Ref: My 375 H & H Remington 700

On May 14, 2004 I was preparing for a Bear hunt here in Alaska. On the 14th I took my rifle to the range to sight it in and all functions worked okay.

On May 22, 2004 I departed on my Bear hunt to the Prince William Sound area via boat. My rifle was kept in a watertight float gun scabber. The weather was rainy but the gun was kept as dry as possible. The hunt lasted 8 Days.

On the eight day I confronted a 550 lb Black Bear at the distance of about thirty feet this bear was not a happy camper at this time. I took what I thought was my trusty Remington and took aim. I moved the safety from safe to fire and pulled the trigger, the gun did not fire; now you can imagine what was going through my mind. The Bear did not charge but held his ground, which gave me time to repeat the cycle again, which I did. The rifle did not fire the second time. I was able to back off the bear and was able to get the gun to fire when I held back the trigger and then released the safety on the gun it fired. Note this took place in the span of about one and a half minutes. I got my bear but it could have been just the reverse.

This gun is my favorite rifle for hunting big game. Can you please fix this problem so it does not happen again. My life may depend on it!

*The trig. + inside trig plate is
rusty, preventing proper return
of trig. - Replace complete TPA,
clean action, properly lube, function
test. @ 1/2 msp*
