Dear Sir:

A few years ago I bought a 243 Remington BDL Model 700 for my wife. I put a \$250 scope on it and a beautiful leather sling. My wife went hunting buck with it the first year and shot a nice 6-point buck. The next year she went hunting she came home disappointed, and upset, as when she aimed at the deer and squeezed the trigger, the gun "clicked" but did not go off, but when she pulled up on the bolt, it fired, and burned her fingers when it went off. I took it to a gunsmith, he said he couldn't find nothing wrong with the gun, but he didn't try it with bullets in it. He just pulled the trigger to see if anything would happen. From then on, my wife has been afraid of the gun, maybe the same thing could happen again. I took it out about a week ago and tried to shoot a very large coyote with it. I got a good aim and squeezed the trigger. It just "clicked" I pulled up on the bolt to get the shell out and the gun went off, scaring me to death. We have to do something with this rifle before someone gets hurt. What do you suggest. Should we send the gun or just the bolt. If someone gets hurt over the malfunction of this gun, someone will have to do something about it. You let us know what our alternatives are.

Sincerely,

Chet Petrosewitz
