Enclosed is a prepaid UPS shipping label to cover shipment of your firearm to our factory for examination and service request.

Please include a copy of this <u>letter and service request</u> to put inside the shipping container. The letter and service request inside are important as sometimes the outside label gets damaged in transit and we want to be sure the firearm is logged in correctly. Mark the ends of the box with "Product Service". Product Service will be inspecting the firearm and will contact me with the results. I will contact you once I get the report.

I hope this action will keep you a loyal Remington customer.

Sincerely, Dell Fulcher Consumer Affairs Administrator Remington Arms Co., LLC

Dear Remington,

My Remington 700 BDL .30-06 has failed on me on two occasions (with live ammunition) and I have been able to recreate the failure several times in a controlled situation without live ammunition.

I bought the riffle used in March 2011 from a local private party. He was an older man that was selling the riffle because he was no longer going to hunt. He said he never had any trouble with the riffle. I shot it on a few occasions shortly after purchasing it, without incident, and then it was cleaned and stored away until this past fall.

The first time it failed on me was at the gun range in late October 2011. It was the first round I had in the riffle since the past spring, when I went to pull the trigger it was as if the trigger was stuck. I was finally able to get the round to go off after pulling much harder then normal. I then loaded another round into the chamber then pushed the bolt forward then locked it down. I noticed the trigger would not go off, but this time the trigger was in a position where it would be if the round had already been shot. After some investigation we noticed the firing pin (in the back of the bolt) was already in the forward position. I opened the bolt and cycled it, and noticed that each time I would cycle the bolt the firing pin would go forward as the bolt was rotated to the locked position. It did this for several minutes, then finally corrected itself and was fine for the rest of the afternoon; however I was losing confidence in the riffle.

The next time it failed on me was during deer hunting season. It was opening weekend (November 6th 2011) and I had two does come in to a shooting lane, I lined up on one and went to shoot it. As I pulled on the trigger it was like it was stuck again. I tried pulling again (this time I had to pull very hard) and it went off – however I missed the deer, probably because I had to pull so hard on the trigger that it moved the cross hairs off the deer. After I shot, the deer was still standing there so I cycled another round into the camber to try to shoot again. Each time I locked the bolt down I noticed the firing pin would cycle down with the bolt and I could not shoot the gun. It did this for several minutes again and then corrected itself. As it was in this 'funk' I noticed something very scary, I was able to get the firing pin to fire (without ammunition), by using only the safety switch. I did this by cycling the bolt, I pushed the bolt forward but before I locked the bolt down I put the safety on then locked the bolt down. I then put the safety from safe to fire (without touching the trigger) and the firing pin went off – again I did not have any ammo in the riffle. At this point I completely lost confidence in the riffle and knew I needed to get it repaired before putting another round in it.

I have been able to recreate this several times without live ammunition using an empty casing.
