Subject New Bolt Action Rifle.

Approximately two years ago we discussed the possibility of adding a bolt action to certain fine rifle to the new family line of guns. We discussed several features which were attractive & similar to those in the new automatic rifle such as quick change interchangeable barrels, retention of point of impact multiple lug rotary bolt using the same bolt head mechanism of the automatic & the same box feed system. Since that time other ideas have features have come to mind & I am taking this opportunity to list them for possible future activity.
as follows:

1. Magnesium skeleton frame for the stock covered with suitable high grade wood. This feature would provide rigid & adequate bedding & prevent point of impact shifting normally found with long stocks. The frame as we know it now contemplated for use in the 742X & 1100X would be an integral part of the magnesium skeleton. The integral hand & barrel extension would attach

~~Proposed~~
Alternation Means

2. Interchangeable Calibers & barrel assemblies with repeatable point of impact without adjustment.
By using the same locking means as used in the 742X, would be desirable. The back section of the barrel extension would be different than the 742X to allow for the bolt manual bolt action. The break action might present problems with the fore end - perhaps a vertical assembly is best.
3. Detachable box magazine on all rifles is the most desirable & sought after feeding device. In this design add using of the 742X box would be the plan.
4. Recoil reduction can be ~~achieved~~ ^{achieved *} by adding adhesive base plate ~~under~~ to the 742X.
5. The total gun wt. unwooded should not exceed 7 $\frac{1}{4}$ for 30'06 oz. less Caliber
7 $\frac{1}{2}$ for 190g. Caliber.
6. The new gun ~~must~~ ^{must} have a similiar appearance to a high grade bolt action rifle. It is possible that pre formed shapes including checkering can be made in 2 halves then joined by adhesive surrounding the magazine & bolt action center.
7. Match type adjustable fire control rust proofed & sealed is necessary for adequate performance.
8. Rust proofing of the entire gun is mandatory. The utilization of rust proof materials, plastic & solvents is recommended but appears to be difficult.

9. A well designed gun should have facilities
to accommodate ~~some~~ open, ~~open &~~ ~~scope~~ sights
Providing any type of sights on the individual gun
is questionable, but ~~excellent~~ sights of ^{all} categories
should be available
