Revised M/788 Trigger Housing Assembly

The attached estimates show the economic results of proposed revisions to the M/788 Trigger Housing Assembly. These changes, which include redesigning the Safety, Safety Detent Plunger, and Safety Plunger Spring, result in a \$690 savings in operating cost (incremental basis). However, this savings is offset by amortization of the \$18,000 operations expenditure which would be required, and the net return on total capital is negative.

The effect of these revisions on the M/788 line is a \$.05 reduction in unit cost (full allocation basis).
