

X-Mark Pro Trigger

- Work proceeding on adjustment wrench
 - Revised quotes in from vendor for tooling and piece price
 - Quote reviewed by Todd Cook
 - Issues with using unheat treated stock for hex keys – needs to be heat treated
 - Design will be finalized after meeting with vendor
- Draft of owner's manual update on adjustment of trigger pull is complete
 - Need review and sign off by all concerned parties on the update so that the revision can be incorporated and the new owner's manuals printed to coincide with the introduction
 - Given the divergence of the 700/Seven product lines from the 710/715/770, a separate owner's manual makes more sense
 - A decision on separating the owner's manuals needs to be made now so that work can proceed to add the adjustment revision
- Trigger pull changes by **~1 lb per revolution** or full turn of the external adjustment screw. MIN to MAX trigger pull adjustment range is ~+3 lbs.
