

WOOD - contd.Finishes

The Benjamin Moore Paint Co. furnished 25 gallons of lacquer for a production run. Experimental work indicates the proposed lacquer is better than that presently used. This test run should determine if the change should be made to the Benjamin Moore product or if the filler proposed by the Marshall Laboratory of the duPont F & F Department should be used.

Approximately two hundred (200) Model 1100 Stocks per day are being processed using the buffing and extra coat of RK-W finish. It is planned to hold production at this level until the Harper machine to reduce hand labor is received in February.

The meeting adjourned at 10:35 a.m. The next meeting is scheduled to be at Iilon Thursday, December 15 at 10:00 a.m.
