11/30/10 Per email sent to Remington.com, incid # 101123-000086, "I have a .300 short mag in the Remington Model 700 SPS Stainless class. Yesterday, while elk hunting, as I settled in to prepare for a shot, as soon as I released the safety to the fire position, the gun fired. Obviously, I was not expecting the gun to go off at that moment. I was very sure not to have my finger near the trigger as well and fortunately I was not pointing the muzzle anywhere near my hunting partner. He too was very surprised when my gun went off as that was not the plan. I had another event with the same results at the end of deer season last year when my Model 700 went off when I released the safety preparing to fill my doe tag. At that time, I thought it may have been my error, but as I recall now, I did not have my finger near the trigger then either. I have read a few articles that address concerns with the Model 700, but they both referred to the trigger mechanism. In the case that I have stated, it has been when I release the safety to shoot mode. I really enjoy the rifle, but as you can imagine, I am having some real concern with the safety and confidence with it if there is a problem. The one article in Field & Stream by Mr. Petzel states more of a "gun handling" issue and I agree with that in most cases. But when the gun discharges while placing the safety in shoot mode, there is something wrong."cm

To whom it may concern,

I have a .300 short mag in the Remington Model 700 SPS Stainless class. Yesterday, while elk hunting, as I settled in to prepare for a shot, as soon as I released the safety to the fire position, the gun fired. Obviously, I was not expecting the gun to go off at that moment. I was very sure not to have my finger near the trigger as well and fortunately I was not pointing the muzzle anywhere near my hunting partner. He too was very surprised when my gun went off as that was not the plan.

I had another event with the same results at the end of deer season last year when my Model 700 went off when I released the safety preparing to fill my doe tag. At that time, I thought it may have been my error, but as I recall now, I did not have my finger near the trigger then either.

I have read a few articles that address concerns with the Model 700, but they both referred to the trigger mechanism. In the case that I have stated, it has been when I release the safety to shoot mode. I really enjoy the rifle, but as you can imagine, I am having some real concern with the safety and confidence with it if there is a problem. The one article in Field & Stream by Mr. Petzel states more of a "gun handling" issue and I agree with that in most cases. But when the gun discharges while placing the safety in shoot mode, there is something wrong.

Can you please offer up some suggestions or recommendations? I am really afraid to put a great deal of confidence in this rifle and my wife does not even want me to take it out until it is "bomb proof safe" or I replace it.

Thank-you for taking the time to read my letter of concern and I appreciate anything you might offer up to help me with this.

Sincerely,

Mark S. Kipley
