REMINGTON ARMS COMPANY, INCORPORATED - ILION
MAINTENANCE ENGINEERING - LUBRICATION OF RIFLES

Scope of Work

Remington Arms Company is interested in developing a cleaning and lubrication procedure for the Model 700 Fire Control that can be included in the rifles instruction manual. It is intended that the cleaning and lubrication procedure be done without disassembly from the receiver and the products used should not gum up the close tolerances of the mechanism. The products selected should also be readily available on a nationwide basis, be non-flammable and non-toxic, as well as operate from -20°F to 120°F.

An evaluation program was conducted that consisted of a preliminary review of all potential cleaning and lubrication candidates within the proposed guidelines. Selected products were screened for rust removal, rust prevention, grease displacement, water displacement, cleaning capability, and appearance on metal and wood parts of the firearm. Details of the products tested, description of the tests and test results are included in the attachments of this report.

Test Results

Over 40 different products were considered in the initial screening phase of this program. The number was reduced to 25 for physical properties and performance evaluations. This number was further reduced to 5 candidates as follows:

1. Du Pont - Synthetic Diester
2. Krylon Ten-4
3. Sprayon 711*
4. CRC 3-36*
5. Houghton HLP

* Included in the attachment for Sprayon 711 and CRC 3-36 are the results of extensive firearms tests conducted by various military and police protection agencies.

Recommendations

The products listed above meet all of the basic requirements for a firearms cleaning and lubricating agent. It is now recommended that Remington Arms proceed with field tests as well as dry firing test in a hot and cold environment.

DESCRIPTION OF TESTS

1. Odor
Comments are made concerning the general impression of the odor when first applied and after about 5 minutes.
2. Feel
The lubricant was applied freely to the fingers and a judgment was made as to the product feel after the propellant had dispersed.
3. Drying Rate
The product was applied to a clean metal surface and the drying rate estimated for the first 10 minutes.
4. Penetration
A single drop of product was applied to a special lubricant white blotting paper. The rate of absorption, size of final diameter and stain appearance was noted.
5. Surface Wetting
A single drop of product was applied to a clean polished metal aluminum surface. The wetting and cleanup properties were noted.
6. Grease Displacement
A thin layer of grease was applied to a clean metal surface, then a single drop of lubricant was applied. The dissolving rate and cleanup properties were noted.
7. Container
The type of product container is noted.
8. Liquid Appearance
The appearance of a puddle of liquid in a watch glass was noted.
9. Wood - Open Pore
The product was applied to the surface of an unprotected section of walnut and the reaction noted.
10. Metal Surface
The product was applied to a freshly polished steel surface and observed up to 24 hours.

11. Rust Removal

The product was applied to a well rusted steel surface. The surface was lightly wire brushed after 10 minutes and the results noted.

12. Displaced Moisture

A solvent cleaned trigger assembly was wetted by dipping into water. The product was then applied and the assembly examined for residual water. Water droplets were then applied to the surface to observe rewetability.

13. Displace Solids

A solvent cleaned trigger assembly was coated with a wet flour paste. The product was applied and the assembly observed for residual flour.

14. Gun Barrel

The product was applied to the surface of a gun barrel, then wiped with a dry cloth. The feel and appearance of the metal surface was noted.
