

Fire Control

The manufacturer warns against any trigger adjustments, however, there are adjusting screws for trigger pull and engagement. The trigger pull screw is located at the front of the fire control housing and the engagement screw is at the rear. Both screws have lock nuts. The trigger pull adjusting screw is also painted red. The fire control is a complete sub-assembly and is screwed to the receiver by only one screw. The trigger and sear have direct engagement in this fire control also. (Photo #7)
