

**Ref. #010306-000026**

I purchased the remington 710 last night and took it home to clean and assemble.

The scope was already mounted.

I can't get the bolt to go in. it appears that the scope is preventing me from achieving the "twelve o'clock" position for assembly that is required by the owner's manual.

Please advise, I do not want to force the bolt or damage the receiver or flaw the scope

Thank You

Benjamin Young

hello,

the question that i have come across often is, will the new 710 combo come out in other calibers?

if so how soon could we see the new calibers on store shelves?

we do large amounts of varmit hunting, in turn we would like to see some varmit calibers: 25-06,22-250,243,223 ans such.

do you possibly know what calibers will be run? also while at a local gun store we were told that you had recalled this model several times now, what were the problems and are they fixed?

thank you very much

doug neighbarger

Recently talked with a dealer to inquire about model 710. He indicated his stock had been recalled due to a defect discovered. I am considering purchasing this model. Can you elaborate on the recall.

I am amazed that Remington did this.... why didn't you just tap the model

710 to model 700 specifications for scope

mounts...unbelievable!!!!!!!!!!!!!!...Dean Rahlves

I have been to two (both) of my gun dealers looking at the new mdl 710. Both suppliers have had to send back every single 710 they've received due to either cartridge feed problems, eject problems, or other problem relating to the action or magazine. I'm still interested in the rifle because it will suit my purpose well for Northern Michigan whitetails. As a loyal Remington shotgun and rifle owner, I'd like to hear your
