Dear Richard,

Thank you for your interest in the new Model 710. The bolt on the Model 710 is not like a conventional bolt action rifle. For the last 100 plus years, bolt action rifles have all basically been made the same way; the locking lugs on the bolt lock up into the receiver, while the barrel is screwed on. The Model 710 is a completely new way of thinking. The bolt locks directly into the barrel, and the barrel is hydraulically pressed into the receiver. Also, there are three locking lugs instead of two. This gives the rifle exceptional strength and accuracy.

Since the bolt locks into the barrel, the receiver now simply guides the bolt. The receiver of the Model 710 has a self lubricating synthetic insert to guide the bolt into the barrel. With this new insert, and the three locking lugs, there is a completely different feel. When pushing the bolt forward, there is a different feeling than on the Model 700 or Model Seven. This is because of the contact of the metal bolt and the synthetic insert and is normal. The "feel" is different, but the quality and performance of Remington is still there.

We hope that this information will be helpful to you. If you have further questions feel free to contact us. We feel that you would be making a good purchase with either rifle. They are both quality built firearms.

I was wondering the differences between the model 700 and the model 710. I am planing on buying a remington soon and i was wondering what would be better, a model 700 ADL synthetic or a Model 710. These guns will both be .270 so please let me now which one is a better buy. thank you.
