Remington® Introduces New Integrated Security System

Madison, NC - Remington Arms Company, Inc., now provides a simple and effective means of increasing the security of their firearms with the addition of the new Integrated Security System (ISS). All "cross bolt safety" shotguns and rifles and all bolt action rifles currently produced by Remington (excluding our law enforcement products, EtronX™, Model 300 Ideal and muzzleloaders) are equipped with the ISS.

No more tedious trigger blocks or cables to deal with as a simple turn of the special "J" shaped key provides the owner of the firearm with the option of rendering the firearm inoperable during times of storage or non-use. Two distinct safety systems have been developed; one for bolt action firearms which prevents locking the bolt in the closed or "fire" position and one for products that utilize a common fire control which effectively locks the safety button in the "safe" position. A retrofit kit is available to current owners for models with common fire control through Remington authorized repair centers.

ISS has been added without jeopardizing the famous look and feel of Remington firearms and does not effect the basic operation of the firearm's safety mechanism. Although it significantly extends overall firearms security, ISS does not eliminate or alter the need for safe gun handling and storage. Models that are not fit with the ISS system will be packaged with a trigger block.
