Extractor: The Model 7400 and 700 have the same extractor, some 314 7400 and 700 have the same extractor, some 314 7400 and 700 have the same extractor. Difficult to install. See a RARC or gunsmith for assistance.

<u>Cleaning Instructions:</u> Clean from the muzzle end to the receiver with bore cleaner. If the chamber area is not cleaned properly it may rust. Use chamber brush that comes with the firearm to keep chamber clean. We do not recommend removing the barrel or bolt for cleaning. See a RARC or gunsmith for professional cleaning.

<u>Sights:</u> The Model 7400 sights are the same as the Model 700 sights. We offer a high front sight that will make it easier for the consumer to line up. The receiver plug screws do not fit in the sight holes. The Model 700 receiver plug screws will plug the holes.

Barrels: All of the Model 7400 barrels are 22 inches except for the earbine, which is 18 inches long. We do not recommend removing the barrel.

<u>Trigger Assembly:</u> The trigger assembly is similar in design to the Models 1100, 11-87, and the 597 (the trigger, hammer, sear, and sear spring are the same). We do offer a left-hand trigger assembly for the 7400. Only put a small drop of oil on the trigger. Cross lock safety.

<u>Trigger Plate Pins:</u> You have to knock the trigger plate pins out in order to remove the trigger assembly (no trigger guard screws). If these will not stay in place the front or rear detent spring may be broken or missing (if this is the sage sell them another one).

<u>Trigger Guard:</u> The trigger guard is made out of a synthetic material (plastic) (the only ones that we still make out of powdered metal are the police models).
