The sear lift measurement criteria were .006-.018", due to the alterations to the connector the sear lift maximum value may exceed the .018" spec. The critical side of this spec is the minimum which will not change.

**Importance:** High

Attached is the list of inspections, measurements and tests we plan on doing on this third set of guns along with the schedule to accomplish this. Gun delivery is expected sometime this Thursday. Test completion is Friday, Dec 15th. Get back immediately if you have any issues with anything in this plan.

Scott
