Dear Tom:

This condition can occur when there is increased engagement of the sear on the trigger. This is not unheard of but should not typically happen. Please contact us at (800) 243-9700 so that we may determine what steps we should take to rectify this. Thank you for visiting Remington Country and we appreciate the inquiry.

I've noticed that when I work the safety on my rifle, the trigger pull is noticeably harder than if I had not used the safety. In other words, if I chamber a round and utilize the safety the trigger pull is much more stiff than if I had simply chambered a round without using the safety. I had my local Rem. authorized gunsmith weigh the trigger pull and he said that without the safety the pull is about 4.25 lbs. and with the safety being flipped from safe to fire the pull increases to just over 5 lbs. why would this be? What should I look at as the problem or is this standard behavior? Any help would be greatly appreciated.
