Dear Dan:

Thank you for your inquiry. We would recommend that you read our important safety message that is included on our home page. You may find this article through the link below:

http://www.remington.com/Safety_Modification_Program/remington_safety.htm

We find it very informative to read all the links that are associated with the modification program. We hope that this information is helpful to you.

I'm a little late I know, but I found some disturbing info on the net about the 700 firing when the saftey lever was pushed into the fire position. My first thought was someone had their finger on the trigger, so many claims say no that is not the case. I own two model 700s and they are my pride one is a 1969 rifle chambered in 6.5 rem mag., the other is a new gun chambered in .300 ultra mag. I love both of these rifles, when I asked how I feel about them I always say, "I would rather carry a 700 to battle than an AR-15." Myself I have fired many rounds taken my share of game and enjoyed my rifles safely for years, is there any reason I should be worried in the future for myself and my family, or are these claims acts of tinkering or modifications. I am asking for a concise answer because I am one of your biggest fans of the 700, planed on buying another model 700, and after reading about this I feel as if people are speaking poorly of a member of the family. I guess I need some piece of mind that my 700s are still what I thought they were yesterday.

Thank You

Dan Clemons
