1993 Product Introductions

- o New Bolt Action Rifle (NBAR) - stainless steel
A special meeting will be called by H.C. Munson to address and resolve the specifications.

It was proposed that the first year of introduction for this product also address the need for a stainless steel offering. Components to be stainless steel would be the barrel, receiver, bolt and bolt handle. The floor plate, trigger guard, sights, magazine box and magazine follower must be processed to look like stainless steel. It was also proposed that this gun have a synthetic stock. First year caliber offerings in the stainless version would be: 7MM Mag, .243 Win and 30-06.

During the first year the present Model 700 ADL and BDL would remain in the line.

1994 Product Introductions

- o New Bolt Action Rifle (NBAR)
During the second year of production, the NBAR will replace all Model 700 BDL's. The caliber offerings in the stainless steel version will be expanded to include the .243 Win and the .300 Rem Mag. The balance of the BDL line (including the varmint) will be replaced by a non-stainless steel version of the NBAR. An alternative to this would be to replace all long action BDL's in 1994 and defer the replacement of the short actions to 1995.

The Model 700 ADL will remain in the product line.
