cam on the safety switch lever lifts the rear safety cam from the connector and positively blocks the firing pin from moving forward. Therefore, when the safety is "on", there is no way the firing pin can go forward to contact the primer and fire the chambered round. By Model 600 design, it is a mechanical impossibility to fire the rifle with the safety engaged.

Our experts also repeatedly tried to fire the rifle upon safety release (off position) without touching the trigger, and no malfunctions of this type were experienced. After numerous attempts to fire the rifle upon safety engagement and upon safety release, the only manner in which your rifle was made to fire was to release the safety and to pull the trigger.

Even though your Model 600 is involved in a trigger modification program, the trigger mechanism in your particular firearm is in safe, proper working condition. Only a small percentage of the
