Dear Sir:

I am sending my 7mm Express back due to a malfunction with the trigger mechanism. The rifle has had only two shells fired through ^{it} since it was purchased. The first shot fired went off as soon as the bolt was dropped into the locking position. After it discharged I inspected the bolt for debris and found none so I reloaded the rifle with another shell and the same thing happened. I tried to remove the bolt from the gun and was unable to. I also noticed that the safety would not come out of the firing position.

After inquiring about these problems, I found there was a recall on the gun. Please inspect and repair the rifle so that a mishap cannot happen causing injury or death.
