I contacted my Remington gan dealer after these recent incidents. He informed me that WD-40 would cause the firing mechanism to stick on cold days. I can not imagine that WD-40 would cause this severe a problem. I would like to know what Remington's experience has been with WD-40 and other oils and if the oil could have possibly caused the problem.

Also, I would like to know if there has been a recall of any sort on either gun. I want to know what Remington will do about the problems that I have encountered with these particular Remington models.

Please reply to this letter because I, as my father, have been an avid Remington gum users for marry years.

Sincerely,

Douglas R. Berry
