BOSTON 15, MASS.

Commonwealth 6-6623

My counterweighting is similar but with one bar resting on the right shoulder with a counterweight out back. The weight of the whole weapon rests on the shoulder and does not have to be supported by the arm muscles. And the aiming is transferred from the forearm muscles to the unloaded arm control muscles. This arrangement is very steady. It can, of course, be made collapsible.

Sincerely yours,

- F. Bunham Chapman
