LLOYD FOX

We would appreciate information on the cost to manufacture a firing pin with flat sides like the marked print attached (C-22020).

On May 25th of this year we had requested costs on this shape made by blanking and forming. At that time it looked as though the costs would be higher than our present firing pin and nothing was done. Because of improved performance with this type firing pin, we would now like to get costs.

Since our first request we made samples by machining our present firing pin. This might be cheaper than the blank and form method.
