SUBJECT: MODEL 600 FIRE CONTROL STUDY

The Product Safety Committee met June 20, 1975, in
Illion to review the Model 600 fire control investigation.

In summary, (Bob Sperling will issue the meeting
minutes) the Production and Research plans to improve bolt
action fire controls were accepted. The recent audit indicates
the new procedures instituted by the Plant have eliminated the
"trick" safety condition on all bolt action guns. Design
improvements which will be in production within the next six
months will give additional assurance there will be no recur-
rence of the problem.

It was agreed that the section of the gunsmith manual
which covers bolt action fire controls will be rewritten to
include the additional checks and recommended corrective action
for the "trick" safety condition.

No further action is contemplated at this time.
