SUBJECT: MODEL 600 FIRE CONTROL STUDY

The Product Safety Committee met June 20, 1975, in  
Illion to review the Model 600 fire control investigation.

In summary, (Bob Sperling will issue the meeting  
minutes) the Production and Research plans to improve bolt  
action fire controls were accepted. The recent audit indicates  
the new procedures instituted by the Plant have eliminated the  
"trick" safety condition on all bolt action guns. Design  
improvements which will be in production within the next six  
months will give additional assurance there will be no recur-  
rence of the problem.

It was agreed that the section of the gunsmith manual  
which covers bolt action fire controls will be rewritten to  
include the additional checks and recommended corrective action  
for the "trick" safety condition.

No further action is contemplated at this time.
