

Magazine

This standard grade rifle does not use a hinged floor plate. The magazine box is friction fitted to the receiver and then assembled to the stock from above. This magazine box contains a filler piece that is spot welded to the back of the box. The "W" type spring slides into grooves in the bottom of the follower while the opposite end of the spring slides into a stamped spring retainer. (Photo #7)

This spring retainer fits into a machined recess in the stock and keeps the spring from shifting. This design is similar to our ADL Model 700 if the spring retainer was omitted.
