TO: J.W. Bower

PROM: NR.S. Murphy RSM

#### Quarterly Report - December, 1984

### HIGHLIGHTS

- Due to delays in receiving prototype parts from the Model Shop, NBAR design evaluation will not begin until early January.
- The Custom Shop is building .350 Rem. Mag. rifles for test; evaluation and transmittal will follow.
- Research support to Process Engineering regarding the Mountain Rifle is continuing.

88 a

#### Quarterly Report - December, 1984

#### New Bolt Action Rifle

A new bolt action rifle is being developed as a potential replacement for the Model 700, possibly in 1988. Technical improvements over the Model 700 include enhanced safety, a detachable magazine, a claw-type extractor, an independent bolt lock, and integral scope mounts.

The design evaluation scheduled for December has been delayed until January due to difficulties in scheduling prototype parts through the Model Shop. Components yet to be delivered include long action bolts, short action stocks, trigger guards, magazine boxes, followers, and triggers. The delay of the bolts is critical to the start of testing since after receipt from the Model Shop they must be processed through production before final heading of the barreled actions can be started. Of the remaining components, all but the magazine assemblies should be completed before final heading of the barrels. The trigger guard and follower are being processed through the N/C Shop and I cannot estimate a realistic completion date.

Five rifles have been readied for Focus Panel reviews of several cosmetic features including receiver, bolt handle, bolt plug, and stock styling. Marketing is scheduling the reviews that may start as early as January, 85.

#### Model 700 Chassic - .350 Rem. Mag.

Remington is continuing the limited run, special caliber offering in the Classic line by reintroducing the .350 Rem. Mag. in 1985.

Research involvement is limited to strength, accuracy, and feeding testing as well as the transmittal of model drawings. The Custom Shop is assembling the rifles and a test outline has been written in anticipation of their receipt.

#### Mountain Rifle

Scheduled for a 1986 introduction, the Mountain Rifle will address the higher end of the bolt action rifle line and replace the Model 700 Classic.

N/C Shop fabrication of the stock former is continuing at an unacceptable pace and will probably interfere with the trial and pilot schedule.

RE: October Monthly Report

700 Mountain Rifle

Research assistance to Production is continuing and a transmittal involving changes to the stock, grip cap, fore-end tip and receiver plug drawings is complete. N/C work is underway on the stock former. (The importance of this work must be stressed with Bob Sanzo.)

Research has yet to develop a final grip checkering pattern. This will be scheduled.

NBAR F.E. Martin - R.S. Murphy

A total part drawing package is five (5) drawings short of being complete and these will be done by Wednesday, October 24. All components will be in the Model Shop also by Wednesday. Prototype samples for test are expected by December 1.

Investigation of tolerance stack-ups as well as outlining future testing will begin this week.

"CONFINE YOUR LETTER TO ONE SUBJECT ONLY"\_\_\_\_\_

September 11, 1984

- TO: J.W. Bower
- FROM: <u>R.S. Murphy</u>
- RE: Quarterly Report September, 1984

#### HIGHLIGHTS

- The 700 Mountain Rifle economics have been approved and Process Engineering work is underway.
- Transmittal of the Sportsman 78 short action calibers is complete.
- The Ducks Unlimited Model 700 Dinner Rifle transmittal is complete.
- New Bolt Action drawing, C.V., and prototype fabrication work is continuing.

#### Model 700 Mountain Rifle

Scheduled for a 1986 introduction, the Mountain Rifle will address the higher end of the bolt action rifle line and replace the Model 700 Classic. Project economics have finally been approved and a Process Engineering master schedule has been developed.

The N/C Shop fabrication of the stock former is continuing in an effort to meet the Process Engineering schedule.

#### Sportsman 78 - R.S. Murphy

With the addition of the 308 and 243 short action calibers planned for 1985, the Sportsman 78 will offer a more complete line to the cost conscious shooter. Since these calibers already exist in the present 700 line, our total Research commitment will be limited to the transmittal and a limited trial and pilot evaluation. The drawings and

Sportsman 78 - cont'd.

!

parts list transmittal is complete and the remaining evaluation will be scheduled.

- 2 -

#### Model 700 Ducks Unlimited - R.S. Murphy

For the first time in 1985, Remington will produce a special, limited production Ducks Unlimited Dinner Rifle. Since the variation from a standard Model 700 entails only cosmetic changes, the total Research commitment will be limited to the transmittal and the trial and pilot evaluation. The transmittal is complete and the evaluation will be scheduled.

#### New Bolt Action Rifle - R.S. Murphy, F.E. Martin

A new bolt action rifle is being developed as a potential replacement for the Model 700, possibly in 1988. A "preferred" design has been selected by Marketing and Research, and work on the drawing package is continuing. A limited number of engineering test prototypes are also being built for evaluation in December. Computervision modeling of individual components is being done on a "safety critical" priority basis.

R. S. MurphyR5M From:

Monthly Report - August Subject:

New Product Development - Rifles

Model 700 Mountain Rifle

(F. E. Martin)

(R. S. Murphy)

The N/C Shop has received the tool drawing from PE&C and work on the stock former is being scheduled.

New Bolt Action Rifle

(F. E. Martin, K. L. Calkins, R. A. Jones)

Design efforts on the NBA are continuing in several areas of product development.

An alternate side tang bolt lock design is nearing completion and only requires detailed drawings. Feedback regarding the legal implications of this design is expected from Marketing.

Three-dimensional modeling of critical components on the C.V. System has been started. The complete rifle is expected to be on the system before transmittal.

Final Research cost estimating of the preferred design is continuing and should be complete the week of August 27.

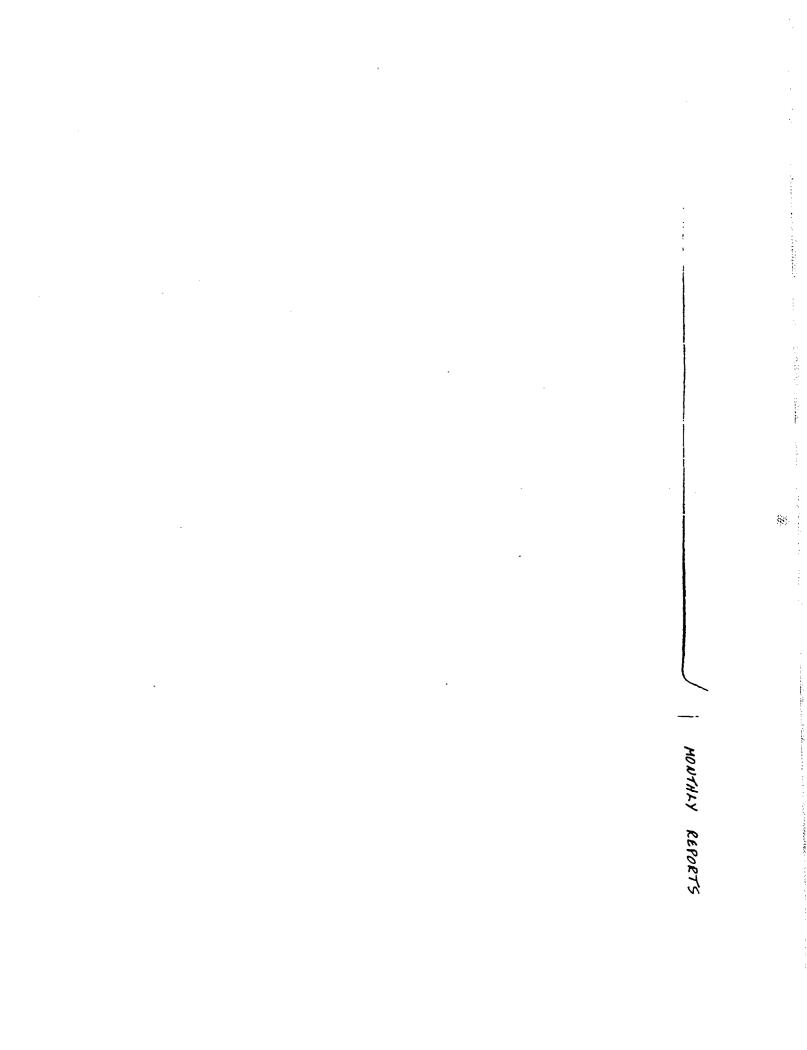

Several components are in the Model Shop for the fabrication of engineering test prototypes.

Marketing has forwarded initial caliber volume and pricing estimates, however, magazine box and bolt handle styling questions still remain.

#### SUBJECT: June Monthly Report

#### M/700 DM

Design acceptance (DA) testing of the M/700 DM started and stopped on June 7 due to feeding difficulties with the magazine. Based on the early test results, the magazine box was moved higher inside the receiver to increase the "interference" of the bolt with the head of the round feeding from the magazine. The increased "interference" cut the malfunction rate from approximately 60% to 0% on the guns that were tested. The design for the boxes and receiver have been modified to reflect the higher position of the shell inside the receiver. The early DA testing also revealed that loading a full magazine of magnum cartridges into a rifle with a closed action was extremely difficult. Modification of the magazine follower relieved this difficulty.

Tooling and components for Trial and Pilot (T&P) are underway. The diecasting mold for the long action trigger guards has been successfully run at the vendor. Trigger guards will be available for T&P and catalog samples. The first investment cast samples of the latches and the long action followers have been received and inspected. Investment cast parts are on schedule for T&P. Trial molding runs from the MIM tooling have been run and downstream process development has The first 100 long action BDL stocks from S&K have been run and begun. are now in Ilion. Magnum BDL stocks will be available in mid to late July. Modifications to the long action magazine spring tooling have delayed delivery of parts from mid-June until mid-July. Samples of magazine boxes made to the new design will be available in mid-August for initial T&P testing. Final production tooling for the boxes will be available in mid-September. Changes to the receiver will be done on the Fadal machining center until new cams are available for the Tri-ordinate machines.

Design acceptance testing will begin on a small scale during plant shutdown and resume in earnest after shutdown. As many pre-production and production parts as possible will be included in the DA testing.

## M/700 Synthetic Stock

The new synthetic long stock mold was run off from 6/22-24. The first samples look very good and are currently in test in the R&D Test Lab. A softer material for the recoil pad was also run at the same time as the stock mold with promising results.

#### M/700 Classic for 1994 - 6.5 x 55 Swedish

The drawing package and parts list for the 6.5 x 55 Swedish were transmitted in early June. The chamber for the cartridge meets the new SAAMI specifications for this cartridge (translation of the CIP drawing to English units).

June 4, 1993

#### TO: Ken Soucy FROM: Jim Ronkainen

#### SUBJECT: May Monthly Report

#### M/700 DM

The first long action trigger guards were received from the R&D NC shop this week. These guards are powder coated and will begin design acceptance testing today. The final drawings for the machined trigger guards are being transmitted today. Tooling for the trigger guard castings is on schedule for a July Trial & Pilot (T&P). Fixturing for the secondary machining is a critical path item for July T&P. Alternate methods for the secondary machining are being investigated to keep the T&P on schedule.

The long action boxes for the design acceptance test have passed inspection. The short action sample is in process at the vendor and is expected in one week. The design of the latch retaining tab has been resolved and was transmitted to the vendor on May 27. Work on tooling for the boxes will commence immediately. Product Team decided all trigger guards and magazine boxes would be powder coated to guarantee a good color match between the magazine box and the trigger guard. It should be noted that powder coating the floorplate will make the future addition of artwork difficult due to the tendency of the powdercoat to fill and cover any surface imperfections, including intentional marking or engraving.

The first stocks inlet for the M/700 DM at S&K were received last week. A cursory check of the stocks here showed a mismatch in the depths of the latch relief cuts, but Maurice Monteau felt this would be an easy item to correct. All other inletting appeared to be good. Maurice will visit S&K next week and run corrected samples for finishing if time permits.

Sample waxes and parts for the magazine latches have been received from the investment casting vendor. Three separate samples of waxes for the long action magazine follower have been received from the vendor. The first two samples contained errors that were corrected in the third and final version of the wax. Approximately 50 investment cast samples of each component are expected here early next week for our evaluation. Design and build of tooling for the secondary machining of the investment cast parts is underway. I visited the mold vendor for the MIM latches to approve the checkering electrodes for the die. The molds for the latches and the short magazine followers are expected the second week in June. Latches for design acceptance testing are being made in the tool room.

Design acceptance testing starts today.

#### M/700 SS for 1993.

Trial and pilot testing was successfully completed.

#### M/700 Synthetic Stock

The drawing package for the Remington made synthetic stock was transmitted in May. Mold run off is still scheduled for 6/14.

The final drawings for the machined trigger guards are being transmitted today. Tooling for the trigger guard castings is on schedule for a July Trial & Pilot (T&P). Fixturing for the secondary machining is a critical path item for July T&P. Alternate methods for the secondary machining are being investigated to keep the T&P on schedule.

The long action boxes for the design acceptance test have passed inspection. The short action sample is in process at the vendor and is expected in one week. The design of the latch retaining tab has been resolved and was transmitted to the vendor on May 27. Work on tooling for the boxes will commence immediately. Product Team decided all trigger guards and magazine boxes would be powder coated to guarantee a good color match between the magazine box and the trigger guard. It should be noted that powder coating the floorplate will make the future addition of artwork difficult due to the tendency of the powdercoat to fill and cover any surface imperfections, including intentional marking or engraving.

The first stocks inlet for the M/700 DM at S&K were received last week. A cursory check of the stocks here showed a mismatch in the depths of the latch relief cuts, but Maurice Monteau felt this would be an easy item to correct. All other inletting appeared to be good. Maurice will visit S&K next week and run corrected samples for finishing if time permits.

Sample waxes and parts for the magazine latches have been received from the investment casting vendor. Three separate samples of waxes for the long action magazine follower have been received from the vendor. The first two samples contained errors that were corrected in the third and final version of the wax. Approximately 50 investment cast samples of each component are expected here early next week for our evaluation. Design and build of tooling for the secondary machining of the investment cast parts is underway. I visited the mold vendor for the MIM latches to approve the checkering electrodes for the die. The molds for the latches and the short magazine followers are expected the second week in June. Latches for design acceptance testing are being made in the tool room.

Design acceptance testing starts today.

#### M/700 SS for 1993.

Trial and pilot testing was successfully completed.

M/700 Synthetic Stock

The drawing package for the Remington made synthetic stock was transmitted in May. Mold run off is still scheduled for 6/14.

#### FIRING MECHANISM FOR FIREARMS

Merle H. Walker and Philip R. Haskell, Ilion, N. Y., assignors to Remington Arms Company, Inc., Bridgeport, Conn., a corporation of Delaware

Application February 12, 1948, Serial No. 7,778

5 Claims. (Cl. 42-,96) 70

1

This invention relates to firearms and has particular refer<del>ence to me</del>ans for controlling the firing thereof.

Many well-known firearms employ a breech closing boit which has a reciprocating movement 5 in opening and closing the breech and which may be locked in the closed position by any suitable means. Most of these firearms are provided with spring-urged bolt mounted strikers or firing pins mounted in the receiver to engage the firing pin or an extension thereof to restrain it against forward movement and to insure trisger controlled release when such release is desired. It is to this type of firearm that our invention is particularly 15 applicable.

A suitable fire control for a firearm of this type provides readily operable means for locking the firing pin positively in a "Safe" position as well as a trigger controlled sear to permit the instant 20 release of the firing pin when it is desired to fire. The value of any safety is proportional to the positiveness of its action. To this end we have found it to be essential that the safety means be so arranged that an inadvertent operation of the trigger while the safety is in "Safe position will not condition the arm to fire upon release of the safety. The value of any type of sear mechanism is proportional to the degree in which it provides for facile, clean, release free 30 from the disturbing effects of drag, creep, o) slap.

It is an object of our invention to provide fire control having a safety which operates by positively moving the firing pin rearwardly out 35 of contact with the sear and there releasably retaining it. In this way, should the trigger be operated while the safety is engaged, the trigger and sear springs will immediately reposition the 40 mechanism to catch the firing pin upon release of the safety.

It is a further object of this invention to provide a sear and control therefor which operate on barely perceptible movement of the trigger, yet releases the firing pin instantly and completely

It is contemplated that these objects may be best attained by mounting on the receiver a housing containing two similarly shaped members engageable with the firing pin in such a 50 way that the firing pin energy urges the members to move out of opposition thereto. One of these members may be conveniently identified as a safety cam and the other as a sear. A safety piece arranged to move into contact with the safety cam and a trigger assembly arranged to releasably oppose disengaging movement of the sear, provide for controlling the movement of these members, and through them the firing pin is controlled.

other objects and advantages thereof will become more clearly apparent from consideration of the specification referring to the accompanying drawings in which:

2

- Figure 1 is a vertical, longitudinal sectional view of a portion of the assembled rifle action. Figure 2 is a rear elevational view of the receiver and trigger housing assembly.
- Figure 3 is a vertical, transverse sectional view and depend upon means relatively fixedly 10 on the line 3-3 of Fig. 1, the stock and trigger guard having been removed to correspond with Fig. 2.
  - Figure 4 is a partial left side elevational view of the receiver and trigger housing assembly.
  - Fig. 5 is a right side elevational view of the fire control assembly, the right-hand side plate and elements supported directly thereon having been removed for clarity in illustrating the interior construction.
  - Fig. 6 is a vertical sectional view taken on the line 6-6 of Fig. 5.

Referring to the drawings by characters of reference, it may be seen that the portion of a rifle action which is illustrated comprises a receiver I which serves as a housing for a conventional type of upturn and pull back bolt 3 and as a mounting for a trigger housing 4. In the usual fashion the rear end of the bolt is closed with a bolt plug 5 which serves as an abutment for the main spring 6 and as a guide for the firing /pin 7. Secured on the rear end of the firing pin by a cross pin 8 is a firing pin head or ecking piece 9. The cocking piece is formed with a rib 10 which is slidably received in a groove 11 in the receiver and with an angularly disposed sear engaging face 12.

A longitudinally extending mortise 13 is milled through the bottom wall of the receiver to accommodate the trigger housing 4 which is secured therein by cross pins 14 and 15 mounted in the receiver and passing through the trigger housing assembly to serve as pivots and stops for elements therein

Between the side plates of the trigger housing 45 which may be conveniently blanked and formed from a single piece of sheet metal, the front cross pin 14 pivotally supports the sear 16 and the safety cam (I. Each of these members occupies substantially half of the width between the side plates and in their top contour they are substantially identical. They are provided with similar striker engaging faces 18 and 19, the angular relationship between these striker engaging surfaces and the sear engaging face 12 being such that there is a tendency for sear and safety cam to swing counter-clockwise about the pivot pin 14 under the urging of the main spring 6 which acts through the firing pin 7. Such an angular relationship between the engaging faces and the The exact nature of the invention as well as <sup>60</sup> radius passing through the contact point is com-

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

3

monly known as a "negative angle" as distinsuished from a "positive angle" where the force domponents act to retain the two surfaces in engagement. This tendency is slightly resisted by the sear spring 20 which engages both sear 5 and safety cam with sufficient pressure to urge them to turn clockwise when they are free from the bring pin load until they are stopped by engagement with pin 15. Positive means to be next described are provided for absolutely preventing movement of scar and safety cam under main spring urging except when such movement is desirable.

A safety 21 is pivotally mounted on a pivot pin 22 which has an enlarged head 23 on the 15 left outside wan or the trigger housing and passes therethrough to support the inner arm 24 of the safety between the side plates and the outer arm 25 outside the right hand wall. A leaf spring 26 is also received on the safety 20 pivot pin and the assembly is held together by a wishbone key 27 engaged with an annular groove The rear end of the leaf spring is 28 in the pin provided with inturned legs 29 which straddle the outer arm 25 and constrain the spring to turn 25 with the safety. The forward or free end of the leaf spring overlaps a hole 30 in the bolt lock arm 32 of the safety. Loosely seated in the hole 30 is a ball detent 31 which is pressed into alternative engagement with detent holes 33 or 30 34 formed in the side wall of the trigger housing to releasably retain the safety in the desired position. It will be seen that the bolt lock arm 32 is in position to pass upwardly through the bottom wall of the receiver into engagement with 35 a notch 35 in the bolt and lock same against rotation when the safety has been turned to its counterclockwise limit of rotation or "Safe" **DO**sition. In the clockwise or "Firing" position, arm 32 does not extend through the receiver wall and the bolt may be readily turned to unlock the action.

Inner arm 24 of the safety is provided with/an eccentric 36 which is disposed beneath the heel 37 of the safety cam. With the safety in "Firposition, the eccentric does not engage the ing' safety cam and release of the cocking piece by the sear will permit the safety to be cammed out of the way. However, when the safety has been rotated into "Safe" position the eccentric 50 has engaged the heel of the safety cam and lifted it slightly. Since the safety cam engages the cocking piece on an angle, the effect of this upward movement will be to cam the cocking piece slightly to the rear. This rearward movement insures that the sear will be returned by the sear spring to position for full engagement with the cocking piece if the trigger should be inadvertently operated while the safety is effective.

As has been previously noted, the sear 16 is of the so-called "negative angle" type and under pressure of the main spring tends to rotate itself out of engagement with the cocking piece. The sear is supported against this disengaging d5 force by engagement of the step 38 with the connector 39. Connector 39 is bent to substantially a right angle and lies against the front face and over the top of the trigger 40 which is pivotally mounted on a pin 41 passing through 70 the side plates of the trigger housing 4. Trigger spring 42 seats against an adjustable screw 43 and bears on the forward face of the connector resiliently urging the connector into engagement with the trigger and through the connector, 75 4

resiliently urging the upper end of the trigger rearwardly. Movement of the trigger is limited in extent by an adjustable rear stop screw 44 which obviously limits the amount of engagement which the connector has with the sear step 38. Ordinarily, this latter adjustment will be made to a minimum safe value and the screw staked in place at the factory. Since the forces upon either screws 43 or 44 are not great, they may conveniently be of slightly greater diameter than the distance between the inside faces of the trigger housing 4 and have threaded engagement with an incomplete thread cut in those inside faces. Forward stop screw 45 serves as a convenient support for the sear spring 20 and passes freely through a hole 45 in the connector to oppose the trigger proper. To facilitate the support of the spring and to provide a rigid mounting, this screw may conveniently be mounted in threaded holes in brackets 45a and **45**b turned inwardly from the side walls of the trigger housing **4**. This stop screw provides an adjustment to positively stop trigger movement just as the sear is released and makes possible the complete elimination of undesirable trigger slap or overtravel. This complete elimination of trigger slap could not, however, be accomplished without endangering the crispness of the letoff if it were not for the flexible mounting of the connector, for it is not practicably possible to produce and maintain absolutely sharp square corners on the engaging surfaces of a sear and conventional trigger. Invariably after normal wear these corners will be rounded on a small radius which will permit the movement of the sear to start before the trigger has fully disengaged therefrom. If the sear is to completely release the striker a conventional trigger must have an overtravel or slap and the release will not be clean and crisp. If we examine the functioning of the unit, we will observe that the trigger and connector move as a unit until the instant the connector starts to clear the edge of the sear step. At this point the trigger stops but the connector is restrained only by the relatively light trigger spring 42 and, as the sear is cammed down, the radii existing on the points of the connector and sear cause the connector to be cammed forwardly and completely clear the sear step. This allows a clean crisp let-off closely approaching the target shooter's ideal without requiring any additional trigger movement after release is first instigated. These advantages of freedom from creep or slap with the short light trigger pull, crisp let-off, and short lock time characteristic of negative angle sears, have been achieved in a construction which is absolutely safe in the hands of the hunter or target shooter and rugged enough to remain so in spite of the abuse and neglect which are often heaped upon sporting arms.

It will be noted that clearance is provided in the lower face of the safety cam so that it cannot engage the connector and that the heel of the sear does not extend to a point where it can engage the safety eccentric. Thus, the operation of safety and sear is entirely independent in spite of their common mounting, common spring, and similar engagement with the cocking plece.

Mounted on the left hand side of the trigger housing is the bolt stop release 47 which has elongated slots 47a and 47b supported beneath the head 23 of the safety pivot pin 22 and onthe left end of the trigger pivot pin 41. A finger

. . . . . . . . . . . .

2,514,981

piece #57 extends into the trigger guard in position/to/ be engaged by the finger for generally vertical/movement and a lateral extension 49 at the upper end engages a notch 50 in the tail of the bolt stop 51. Preferably the slots 47a and 41b are disposed at an angle to each other so that the release has a combined translational and swinging movement, causing the extension 49 to follow closely the arcuate path of the notch 10 50. Support for the bolt stop is provided by the bolt stop pin 15 which, as previously noted, assists in retaining the trigger housing in as-sembled relation to the receiver. The bolt stop is resiliently urged to swing about the pin 15 in a clockwise-direction, as viewed in Fig. 4, by a 15spring 52 seated in a blind hole in the receiver. Extending into the receiver under spring urging and withdrawable by the action of the shooter's finger on the fingerpiece 48 is the bolt stop shoulder 53, This shoulder normally extends a 20 substantial distance into the usual type of guide track 54 for the left hand bolt locking lug and places a definite rearward limit upon movement of the bolt. Since the bolt stop release 41 is protected by the trigger guard from accidental contact with brush, a saddle scabbard or any other object which might dislodge an externally mounted bolt stop, it will be a practical impossibility to inadvertently pull the bolt free of the receiver.

Although a single specific embodiment has been illustrated and described in detail, it should be understood that the invention is not to be considered as limited to the exact embodiment disclosed. It is intended that all modifications and  $^{35}$ equivalents falling within the terms of the appended claims shall be considered as a part of the invention.

We claim:

1. Fire control means for a firearm having a spring urged striker comprising means defining a negative angle sear engaging face on said strik er; a pivotally mounted sear having formed thereon a negative angle face arranged for engagement with the face of said striker: trigger means to releasably support said sear against disengagement from said striker as a result of striker spring force acting through said negative angle faces; sear spring means tending to restore 50 said sear to striker engaging position; a pivotally mounted safety cam constructed and arranged to have negative angle engagement with said striker substantially similar to that of said sear; and manually actuable safety operating means comprising an eccentric member manually rotatable about a fixed axis between a "Firing' position and a circumferentially displaced "Safe" position, said fixed axis being so disposed relative to said safety cam that said eccentric will not 60 engage the safety cam in "Firing" position and in "Safe" position will have engaged said safety cam and shifted same into said further engagement with the striker.

2. Fire control means for a firearm having a 65 receiver and a main spring-urged striker therein comprising an abutment on said striker having a sear engaging surface: a sear pivotally mounted in said receiver and engageable with said abutment surface, said sear being so arranged relative to said abutment that a line projected between the point of contact with said surface and the point of pivotal mounting of the sear makes an angle of greater than 90 degrees with said surface and a component of main spring force 75

acts to disengage the sear from said abutment; a lug on said sear; a trigger; means to pivotally support said trigger with a portion thereof beneath said lug; a connector overlying the portion of said trigger beneath said lug and carried thereby, said connector having an aperture therethrough and providing a surface releasably engageable with said lug; a trigger spring engaged with said connector arranged to act through said connector in opposing movement of said trigger; and trigger stop means passing through said aperture in position to limit movement of the trigger without retarding movement of said connector, said trigger and connector being so constructed and arranged that movement of the trigger into contact with said stop means will substantially complete the disengagement of said connector from said lug and further movement of the connector relative to the trigger will allow the sear to move without material impairment by said connector.

3. Fire control means for a firearm having a trigger housing and a sear which is acted upon by a force tending to release the sear compris-25 ing a lug on said sear; a trigger pivotally mounted in said housing having a surface movable into and out of a position opposed to said lug; a connector carried by the trigger and movable relative thereto, a portion of said connector overlying said surface and arranged to be engaged between said surface and said lug, said connector being arranged on said trigger to be moved thereby in the direction of disengagement from said lug and being also arranged to be capable of movement relative to said trigger in the direction of disengagement from said lug; spring means opposing movement of said connector relative to the trigger; and positive stop means on said housing arranged to block further movement of the trigger after the trigger has been moved to a position in which disengagement of said connector from said lug is substantially complete

4 Fire control means as described in claim 3, 45 said pivotally mounted trigger comprising an elongated member of which an end face forms aid jug opposing surface; and said connector comprising an L-shaped member, one leg of which overlies said end face to be engaged with said lug while the other leg of said L-shaped member lies against said elongated member; said spring means being engaged between said other leg and said housing and tending to yieldingly hold said other leg in engagement with said elongated member.

5. Fire control means as described in claim 4, said L-shaped member being formed to provide an aperture through said other leg; said positive stop means comprising a screw adjustably mounted in said housing and passing loosely through said aperture in position to engage said elongated member when said trigger has been moved to said position in which disengagement is substantially complete.

#### 2,869,269 SAFETY MECHANISM FOR FIREARMS

Wiltrid J. Couture, deceased, late of New Haven, Conn., by Clara M. Couture, administratrix, New Haven, Conn., assignor to <u>Olin Mathieson Chemical Corpa-</u> ration, a corporation

Application June 2, 1955, Serial No. 512,606

# <u>1 Claim.</u> (Cl. 42—70)

This invention relates to a firearm and more particu- 15 larly to a novel safety mechanism for a firearm of the bolt action type.

In bolt action rifles of the upturn and pullback type, it is desirable to incorporate into the gun a safety mechanism which not only can lock the trigger but also can 20 lock the bolt. The former is desirable to prevent accidental firing while the latter is desirable to prevent accidental release of the bolt.

An object of this invention is a safety mechanism for a bolt action rifle which is simple and economical in construction and adapted for use upon a gun of the upturn and pullback type. A further object of this invention is a novel safety mechanism which operates both upon the trigger and upon the bolt so as to completely lock the gun. A still further object of this invention is to provide a novel safety mechanism which permits movement of the bolt while the trigger is locked thereby enabling safe unloading of the gun. Another object of this invention is to provide a novel safety mechanism which cams the cocking shoulder of the trigger against the engaging sear surface of the sear. Other objects will become apparent to those skilled in the art upon reading drawings in which,

Figure 1 is a partial right side view of a bolt action rifle showing an embodiment of the safety mechanism of this invention as it appears in a "fully on" position, that is, when both the bolt and the trigger are locked

that is, when both the bolt and the trigger are locked. Figure 2 is a broken right side perspective view of the rifle showing the safety mechanism and its spring 45 detent,

Figure 3 shows a partial left side view of the bolt action rifle shown in Figure 1 but in which the safety mechanism is in a "partially on" position, that is, locks only the trigger,

Figure 4 is a partial left side view of the rifle shown in Figure 3 showing the safety mechanism in an "off" position, and

Figure 5 is a perspective view of the disassembled safety of this invention.

55

The illustration in the accompanying drawings show the use of the safety mechanism of this invention in a bolt action rifle of the so-called upturn and pullback type. This name is applied because the bolt is withdrawn from the chamber by grasping the operating handle, turning it up and pulling it back. This type of gun generally consists of a receiver 11 of tubular shape having sliding channels on its inner surface to form a bolt receiving passage. It also has an upward facing load and ejection opening 13. A barrel 14 is threaded to 6.5 the front or muzzle end of the receiver, said barrel having a chamber section at its breech end.

A sliding cylindrical bolt 15 having sliding and locking lugs thereon is contained within the bolt receiving passage of the receiver. Operating handle 16 extends 70 sidewise from said bolt. The bolt consists of a tubular 2

casing 17 in which is contained a firing pin 18, spring loaded by a firing pin spring 19. Threaded into the rear end of the tubular casing 17 is a bolt sleeve 20 through which the firing pin extends rearwardly. Ex-5 tending downwardly from the rear end portion of the firing pin is a sear engaging lug 21 which acts as a cocking shoulder for engagement by a sear 22. Scar 22 pivots about sear pin 23 to enable release of the firing pin if it is cocked (as shown). The sear is normally 10 held against the sear engaging lug of the firing pin by sear spring 24.

Extending downwardly from the receiver is a support member 25 which acts to support a trigger 26, a bolt release 27 and a safety 28. The trigger and the bolt release lock are pivoted for rotation about trigger pin 29 while the safety is pivoted for rotation about safety pin 30.

The trigger 26 consists of sheet metal stock having a rearwardly extending lug 31 upon which a trigger pin spring 32 rests in a normally compressed state. A downwardly extending adjustable guide rod 33, adjusted to avoid contact with the rear lug 31 of the trigger pin guides the spring 32 in its operation. Extending forwardly in the trigger and engaging the sear is a cocking shoulder 34. This shoulder contacts the sear 22 at its shoulder 35 and blocks counterclockwise (Fig. 1) movement of the sear until the trigger is pulled rearwardly. When the trigger 26 is pulled rearwardly (to the left as viewed in Fig. 1) the shoulders 34 and 35 slip past one another and become unblocked thus freeing the sear to rotate counterclockwise (Fig. 1) about sear pin 23. The sear spring 24 comprises a flat leaf having a laterally projecting lug (not shown) which engages the sear as at 24a. The sear spring 24 is suitably mounted in the body of the rifle so that it normally tends to cause the sear 22 to rotate in a clockwise direction as viewed in Fig. 1. In spite of the urging of the sear 22 in a clockwise direction by the sear spring, the force of the firing pin spring 19 is dominant and is sufficient to cause 40 the bolt 15 to move to the right when the sear is in the unblocked condition. During the course of the motion of the bolt 15 to the right the lug 21 of the bolt rides over the sear 22 and cams it downwardly in a countordlockwise direction about the sear pin.

The bolt release 27 is also of sheet metal stock having an upwardly extending member 36 which extends through a slot in the receiver 11 and into the slide passage of the front lug of the bolt to prevent complete removal of the bolt. This bolt release is normally kept 50 in a bolt engaging position by spring plunger 37 which spring loads against an upward extending arm of the bolt release 27.

Directly beneath the toad and ejection opening 13 of receiver 11 is magazine 38 of the box type. Within said magazine is contained magazine spring 39, spring loading a magazine follower 40 upwardly. Resting upon said follower is cartridge 41. Additional cartridges may be stored within said magazine, if desired.

The safety 28 of this invention is affixed to the lower end of support member 25. As shown in unassembled relationship in Figure 5, it consists of sheet metal stock folded over at its lower end 51 to form an uneven armed U-shaped member. A hole 52 is drilled through said members to receive safety pin 30, thereby producing a journal bearing for said safety. The short arm 53 of the inverted U-shaped member has a forwardly extending stop member 54 which engages the trigger when assembled upon the gun. The long arm 62 of the shaped member has a much larger forwardly extendlocking lug 55 extending from the lower portion of said arm up through a slot in the receiver. Its tip 56 en-

3

ages a notch 57 in the bolt when said bolt is in battery osition. In an unlocked position it extends to a point polow the notch 57. The long arm of the U-shaped n/en/ber also contains a vertical slot 58 through which leaf spring 59/extends. The lower end of the leaf spring is shaped to encircle the safety pin 30 while the upper end contains a lug 60 which engages a flat on the re-ceiver in which three depressions are formed. Engagement of the lug 60 and the left depression (Fig. 2) represents the position in which the bolt and the trigger are blocked while engagement of the lug 60 with the middle depression represents the position of the safety in which the bolt is free to be opened and the trigger alone is latched or blocked. When the safety is in the righthand position shown in Fig. 2 (with the lug 60 in engagement with a depression which is not visible) both the trigger and the bolt are unlocked. A ratchet mecha-nism for controlling the position of the safety thereby results. Topping the long arm 62 of the U-shaped member is a finger piece-61-having ridges therein for frictional engagement with the thumb of the shooter.

The receiver assembly is affixed to a gun stock 70 by means of trigger guard plate 71 through which bolts 72, 73 and 74 extend and are threaded into the receiver.

To operate the gun, the shooter first loads the gun by opening the action. This is performed by lifting up on the operating handle 16 and pulling back the bolt 15 until its forward locking lug is stopped by the bolt en-gaging arm 36 of the bolt release 27. Cartridges are then inserted through the load opening 13 of the receiver into the magazine 33. The bolt is then rammed home and in so doing, the top cartridge in the magazine is driven into the chamber section of the barrel 14. The rear of the cartridge contained in the chamber, designated C in Figure 1, is supported by the cartridge seat face 80 of the bolt and its rim is engaged by a spring biased extractor S1 which protrudes partly across the cartridge seat face. The operating handle is then turned downwardly to cock the firing pin through engagement of the downward extending lug 21 of the firing pin 18 with the sear 22. This sear is normally held in an ugward position by the sear spring 24.

At this time, it is generally the practice to operate the safety. It is placed in a fully "on" position by pulling the finger piece 61 of the safety completely toward the rear. Lug 60 "snaps" into the several depressions on the flat of the side wall of the receiver. In its rearmost position both the bolt 20 and the trigger 26 are locked by the safety—the bolt by reason of safety tip 56 engaging notch 57, and the trigger by reason of stop member 54 wedging the cocking shoulder 34 of the trigger against the sear shoulder 35 of the sear. A completely safe transportable gun is thereby enabled. Any jar against the trigger or against the operating handle will not cause firing or accidental opening of the bolt because both the pin and the bolt are locked.

Should one desire to unlock the bolt while retaining the trigger in its safety position as generally required when unloading the gun, the finger piece 51 of the cosafety is moved forwardly until the safety lug "snaps" into a center notch. In this condition the bolt can be operated in the normal fashion but the trigger cannot be pulled because it engages nose 54 of the safety 28. The bolt has been unlocked because the safety tip 56 65 has been disengaged from notch 57 of the bolt.

Complete forward movement of the finger piece 61 completely releases the bolt and trigger. The gun may then be fired by pulling the trigger. In such instance, the safety tip 56 is out of engagement with the notch 57 of the bolt and the stop member 54 is opposite a groove 82 in the trigger (see Figure 4).

Pulling the trigger releases the sear 22 which pivots about its sear pin 23 by the force of the firing pin spring 19 acting through the firing pin lug 21. The firing pin 18 is driven into the igniter of the cartridge C by the firing pin spring 19 and bullet is ejected from the muzzle of the gun.

After firing, the cartridge case C is extracted from the chamber by lifting the operating handle 16 and pulling it rearwardly. By so doing, the extractor 81 grips the rim of the cartridge case pulling it rearwardly. An ejector within the bolt housing pushes forward through an orifice in the cartridge seat face thereby causing the cartridge to pivot around the extractor as it clears the forward portion of the load and ejection opening 13 of the receiver 11. The fired cartridge case is thereby ejected. The gun is reloaded by forward movement of the bolt to drive another cartridge contained in the magazine into the chamber section of the barrel. The action of the gun may then be repeated as described above.

Obviously, certain modifications are possible, for example the ratchet mechanism of the safety may be of different design. A projection instead of the leaf spring from the long arm of the U-shaped member may be used to engage the staggered depressions in the flat on the receiver wall. One might also employ a ratchet mechanism at the bearing section of the safety. Another obvious variation could be in the bearing section of the safety. It could be a solid journal having appropriate arms extending therefrom to act as a stop member and a bolt engaging tip. In the gun itself many modifications can obviously be made without changing the opration of the safety. Here again, these should not deter in the scope of the described safety and its use.

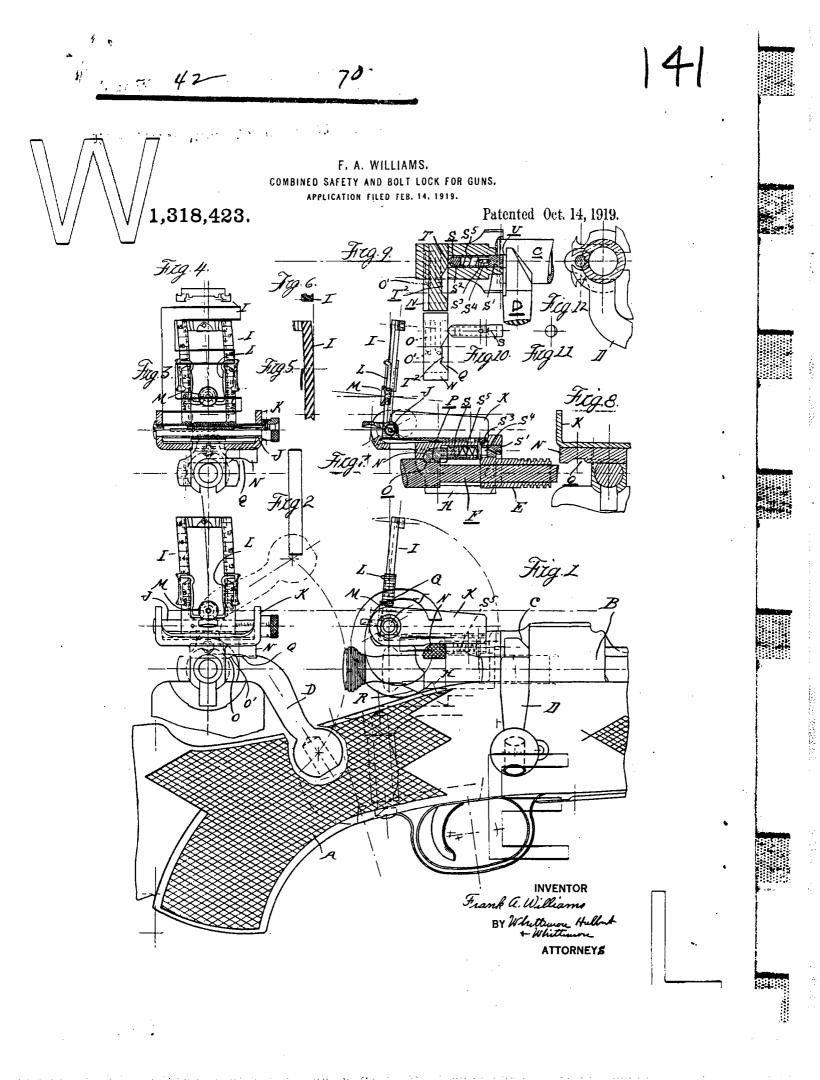

The intentions having thus been described what is desired to be secured by Letters Patent is as follows:

In a holt action firearm including a bolt, a slidable firing pin, a trigger and a receiver, a safety device pivotally mounted upon the receiver, said device comprising a metallic, U-shaped member formed with a locking lug and a stop, said lug and said stop being directly encageable with the bolt and with the trigger respectively for locking the bolt and for blocking the operation of the trigger, said safety device being rotatable to a first position wherein the bolt and the trigger are both locked, said safety device being rotatable to a second position wherein the trigger only is locked and leaf spring means mounted upon the safety device and cooperating with the receiver for locking the safety device selectively in either of said two positions.

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

## UNITED STATES PATENT OFFICE.

### FRANK A. WILLIAMS, OF DETROIT, MICHIGAN.

### COMBINED SAFETY AND BOLT LOCK FOR GUNS.

Specification of Letters Patent.

Patented Oct. 14, 1919. Application filed February 14, 1919. Serial No. 276,944.

To all whom it may concern:

Be it known that I, FRANK A. WILLIAMS, a citizen of the United States of America, residing at Detroit, in the county of Wayne 5 and State of Michigan, have invented cer-tain new and useful Improvements in Com-bined Safety and Bolt Locks for Guns, of which the following is a specification, refer-ence being had there in to the accompanying

10 drawings.

30

1\\$1⁄8,423.

The invention relates to guns of the bolt action type and has particular reference to constructions in which the rear sight is mounted above the bolt. It is the primary

15 object of the invention to obtain a construction of safety which does not interfere with the sight mounting. And further to obtain a construction which performs auxiliary functions as hereinafter set forth.

In the drawings: 20

Figure 1 is a side elevation of a bolt ac-tion gun, showing the rear sight mounted above the bolt and provided with my improved safety;

- 25 Fig. 2 is a rear elevation of the bolt and sight;
  - Fig. 3 is a similar view of the sight de tached;

  - Fig. 4 is a plan view of the sight; Fig. 5 is a longitudinal section thereof;

  - Fig. 6 is a cross-section; Fig. 7 is a longitudinal section through the sight, sleeve, firing pin and safety sembly detached;
- Fig. 8 is a cross-section thereof in the central plane of the safety; Fig. 9 is a horizontal section;

Fig. 10 is a plan view showing the relation of the safety and bolt lock;

Fig. 11 is an end elevation of the bolt 40 lock;

Fig. 12 is a cross-section through the bolt in the plane of the lock.

- A is the gun stock, B the frame, C the 45 bolt, D the actuating bolt handle, E the sleeve, and F the firing pin of a standard bolt action assembly. G is a rear sight as-sembly which is mounted upon the sleeve E,
- but which is also provided with a bearing 50 portion H for slidably engaging the frame so as to accurately position the sight. The construction of the sight assembly forms no part of the present invention, but as shown comprises a leaf frame I which is 55 pivotally and laterally adjustably mounted

on the shaft J in the bifurcated bracket member K, while a vertically adjustable spring frame L engages the leaf and carries the peep sight M.

The mounting of this sight above the 60 sleeve interferes with the use of a rockable safety such as are provided on standard bolt actions, and I have therefore devised a safety of the following construction: N is a bar which slidably engages a transverse 65 aperture in the sleeve between the mounting for the sight and the firing pin. Upon the lower face of this bar are the projecting ribs or teeth O adapted to engage corresponding ribs or teeth P on the firing pin. 70 The bar N is of greater length than the bearing in the sleeve so that it can be adjusted in position by pressure on the projecting end into any one of three different positions. The lower surface of the safety is also cut away at Q so as to permit, in one position of its adjustment, the free movement of the firing pin, while in the other positions of adjustment the engagement of the teeth O and P will lock said firing pin. 80 The entering ends of the teeth O are slightly beyold at O' so that in engaging with the teeth P the pin F is slightly retracted. This has the effect of withdrawing the cocking

ness R, so that in case the sear is withdrawn 85 it can return again, into position for engagement with the firing pin. The safety N is held in its several posi-

tions of adjustment by a spring pressed de-tent S which is arranged in a longitudinal 90 bore in the upper portion of the sleeve E. This detent S also performs the function of a bolt lock and to this end comprises a hollow member S' and a pointed nose member S<sup>2</sup> at one end therpoint. S<sup>5</sup> is a cross pin en- 95 gaging an elongated slot S<sup>4</sup> in the member S', and S<sup>5</sup> is a spring within the hollow member interposed between the pin S<sup>3</sup> and the nose piece S<sup>2</sup>. The safety N is formed with a notch T for engaging the nose piece S<sup>2</sup> 100 when in one position of adjustment, in which position the opposite end of the member S' is projected beyond the bore and into engagement with a recess U in the bolt so as to lock the bolt from turning. The safety 105 N is further provided with a groove T<sup>2</sup> into which the nose piece  $S^2$  is forced by the tension of the spring S<sup>5</sup> when said safety is in the second or third position of adjustment. In either of these latter two posi-110

tions the member S' is retracted into the bore and is thereby withdrawn from engagement with the recess U, permitting the turning of the bolt.

With the construction just described, to place the mechanism on safety and also to lock the bolt from operation, the member N is in the position shown in Figs. 7 to 10. It will be noted that in this position the nose

- 10 piece S<sup>2</sup> being in engagement with the notch
  T will hold the member N with the teeth O in full engagement with the teeth P, and therefore the firing pin is locked from movement within the sleeve. At the same time
  15 the member S being projected into engagement with the notch U prevents the rotation of the bolt. If it is desired to release the bolt and at the same time to continue the locking of the firing pin, the member N is
  20 adjusted to its intermediate position, where
- the nose <u>biece S<sup>2</sup> is in engagement</u> with the slot  $T^2$ . The teeth O and P are still in engagement with each other so that the firing pin is locked, but the movement of the nose
- pin is locked, but the movement of the nose
  piece S<sup>2</sup> into the slot T<sup>2</sup> permits the spring
  S<sup>5</sup> to withdraw the projecting end of the member S', disengaging the same from the notch U and freeing the bolt for rotation.
  Thus, the operator is permitted to remove
  the bolt while the firing pin remains locked.
- 30 the bolt while the hring pin remains locked. In the third position of adjustment the cut away portion Q of the member N registers with the firing pin, so that the latter is free to move whenever released by the sear and 35 the gun is consequently in condition for
  - firing. A safety constructed as above described/in

no way interferes with the sight assembly, for the member N is below the bifurcated 40 member K in which is mounted the trans-

40 member K in which is mounted the transverse pin J carrying the sight leaf. Fur thermore, the safety may be manipulated more easily and conveniently than the rockable construction which has heretofore been 45 used.

45 used.

2

What I claim as my invention is: 1. In a gun of the bolt action type, the combination with a sleeve for the bolt having an upward extension forming a mount-

50 ing for the sight, of a safety transversely adjustably mounted in said upward exten-

sion and engageable with the firing pin. 2. In a gun of the bolt action type, the

- combination with a sleeve for the bolt hav-55 ing an upward extension forming a mounting for the sight, of a safety in the form of a transversely slidable bar engaging an aperture in said upward extension between the sight mounting and the firing pin and en-
- 60 gageable with the latter to lock the same.
  3. In a gun of the bolt action type, the combination with a sleeve for the bolt having an upward extension forming a mounting for a sight, of a safety in the form of a
- 65 transversely slidable bar having a tooth on

the lower face thereof for engagement with the firing pin and being cut away at one point to clear said pin.

4. In a gun of the bolt action type, the combination with a sleeve for the bolt hav- 70 ing an upward extension forming a mounting for a sight, of a safety in the form of a transversely adjustable bar engaging an aperture in said sight mounting and projecting beyond the same, said safety being 75 adjustable into a plurality of positions and having a tooth for engagement with the firing pin in one of said positions and cut away to clear said firing pin in another position. 5. In a gun of the bolt action type, the 80

5. In a gun of the bolt action type, the 80 combination with a sleeve and the firing pin therein, of a safety in the form of a transversely movable bar mounted in said sleeve, said safety bar having a tooth thereon for engaging said firing pin when in one position of adjustment and being cut away to clear said firing pin in another position of adjustment.

6. In a gun of the bolt action type, the combination with the bolt, the sleeve and the <sup>90</sup> firing pin slidable therein, of a safety in the form of a transversely extending bar mounted in a bearing in said sleeve and projecting beyond the same, said safety bar having a tooth on one portion thereof for engaging a <sup>95</sup> coöperating tooth on the firing pin and being cut away at another point for clearing the firing pin.

7. In a gun of the bolt action type, the combination with the bolt, the sleeve and the firing plu, of a safety in the form of a transversely movable bar mounted in said sleeve, having a toothed engagement with the firing pin in one position of adjustment and cut away to clear said pin in another position of adjustment, a spring pressed detent for holding said safety in its alternative positions of adjustment, and coöperating means on said safety for adjusting said detent into locking engagement with said bolt in one of 110 its positions of adjustment.

8. In a gun of the holt action type, the combination with the holt, the sleeve and the firing pin, of a safety in the form of a transversely adjustable bar mounted in said sleeve 115 and having a plurality of positions of adjustment, a spring pressed detent having one end engageable with said safety to hold the same in the different positions of adjustment and the opposite end being engageable with 120 the bolt, and coöperating means on said safety for actuating said detent into locking engagement with said bolt in one of its positions of adjustment.

9. In a gun of the bolt action type, the 125 combination with the bolt, the sleeve and the firing pin, of a safety in the form of a transversely movable bar mounted in said sleeve, the under side of said safety having a tooth portion and a cut away portion, the former 130

•

for locking the firing pin and the latter to provide clearance for said firing pin, a detent cooperating with said safety for yieldably holding the same in a plurality of positions of/adjustment, said safety being fashioned to/react upon said detent to adjust the sanio into different positions, one of said positions of the detent being in locking engagement with said bolt.

- 10 10. In a gun of the bolt action type, the combination with the bolt, the sleeve and firing pin, of a safety in the form of a transversely extending pin engaging an aperture in said sleeve, a detent engaging a longitudi-
- 15 nal aperture in said sleeve having one end operatively engaging said safety and the opposite end engageable with the breech bolt to lock the same, and a bearing on said safety for said detent cammed to actuate the detent
- 20 into locking engagement with the bolt in one position of adjustment of the safety and to release the locking of the bolt in another position of the safety.

11. In a gun of the bolt action type, the combination with the bolt, the sleeve and fir- 25 ing pin, of a safety in the form of a transversely extending bar engaging a transverse aperture in the sleeve and having three positions of adjustment, a tooth on said safety for engaging the firing pin in two of said 30 positions of adjustment, the safety being cut away to release said pin in the third position of adjustment, a detent for yieldably holding said safety in its different positions of adjustment and having its opposite end oper- 35 able into locking engagement with the bolt, and a cammed surface on said safety for engaging said detent to hold the same in locking engagement with the bolt in one position of the safety where the firing pin is also 40 locked, to release said bolt in another position where the firing pin is also released, and to release the bolt in an intermediate position where the firing pin is locked.

In testimony whereof I affix my signature. 45 FRANK A. WILLIAMS.

INTER-DEPARTMENTAL CORRESPONDENCE

$\square$	$ \sqrt{7} $	Remington,	BRIDGEPORT, CONN. SEPTEMBER 14, 1978
		J. W. BROOKS	
	FROM:	W. L. ERICSON	
	SUBJECT:	THREE-POSITION SAFETY: RELEA	SABLE BOLT LOCK

An extensive search has been made for patents relevant to the protdtype three-position safety shown in the "C" series photos you supplied us (stamped April 3, 1978 by your Photo Lab). No patents which could raise any infringement risks were found. The following are of interest with respect to the patentability of this design:

> 2,824,402 - Williams -2,869,269 - Couture -,138,888 - Brewer -

The Williams, Fischer, Couture and Brewer patents show various forms of three-position safeties having alternate "safe" positions in which the bolt is locked and released. However, it appears to me that none of these is so closely related to your prototype as to foreclose us from obtaining patent protection for it, in the event it is selected for use.

Williams uses a safety bat |N which is slidable transversely of thebolt C, and has ribs O that internere with ribs P on the firing pin F in two "safe" positions, but are cut away at Q to define a "fire" position. In one of the safe positions, the bolt C and its handle D are locked by the projection into a recess U of a springloaded detent S (see Fig. 9); but this detent retracts into a notch T<sub>2</sub> in the safety bar in its remaining two positions,

Fischer has a bolt lock button 12, 13 engageable with a notch 14 in the bolt 2 of a Mauser action (Fig. 4); this button carries an interlock pin 26 which is engaged by a safety lever 23 in its "fire" position 23A, to unlock the bolt. "safe" position 23B, the firing pin 4 is 19 (see Fig. 5), and the button 13 can be manually operated to either lock or unlock the bolt. In a second "safe" position, shown in solid line at 23 in Fig. 4, the button 13 is held in the locking position by a notch 28. locking position by a notch 28.

TO: J. W. BROOKS RE: THREE-POSITION SAFETY: RELEASABLE BOLT LOCK

Ĵ.

1

Page 2 Sept. 14, 1978

douture bears some resemblance to our Walker Patent 2,514,981 in that a bell crank lever 28 serves both as a safety and a bolt lock. Nowever, Couture provides for three safety positions rather than two; these positions are determined by a spring-loaded lug 60 engageable in any of three recesses, shown unnumbered in Fig. 2. The safety has a stop member 54 which locks the trigger in either a rear or an intermediate position, and a longer arm 55 which engages a notch 57 in the bolt only in the rear position. (This mode of operation is the reverse of your prototype).

Brewer employs a sliding safety 190 that has a screw 228 which locks the tri<del>gger,</del> and a lug 230 which engages a locking notch 234 in the bolt, in the rearmost safety position shown in Fig. 12. Forward movement to an intermediate position keeps the trigger locked, but disengages the lug 230 from the bolt notch. Incidentally, there are only two detent notches 229 and 231, which correspond to the rear "double-safe", and "fire" positions: so feeling the intermediate position would appear to be somewhat uncertain.

To summarize, the prior art most nearly related to your design is the Couture patent, but this is a one-piece trigger safety and bolt lock that is readily distinguishable both in construction and mode of operation. Patent protection should be obtainable on your prototype.

There is a mention in earlier correspondence of a three-position safety in the Model 725. If you have a sample, we might compare it.

#### 2,824,402

BREECH BOLT AND FIRING PIN SAFETY MECHANISM FOR FIREARMS

Joseph F. Fischer, Grand Rapids, Mich.

Application June 21, 1956, Serial No. 592,846 14 Claims. (Cl. 42-70)

This invention relates to improvements in safety mechanism for fire arms. The principal objects of this invention are:

First, to provide a novel safety mechanism for rifles of the Mauser type which safety does not interfere with the mounting of a telescopic sight on the rifle and which 20 is mounted for easy operation on the bolt handle side of the rifle.

Second, to provide a safety mechanism for Mauser type gun actions which will lock the firing pin in safe position without interfering with or preventing the re- $^{25}$  moval of the bolt from the receiver of the gun.

Third, to provide a safety that locks the firing pin in safe position regardless of the position of the bolt so that the bolt may be opened and closed to inspect the chamber of the gun without removing the safety lock of the mechanism.

米

Fourth, to provide a firing pin safety lock with an operating member that interlocks with the bolt lock of a Mauser type rifle to hold the bolt in closed, locked position and the firing pin in cocked, locked position as when the gun is double locked for rough handling or transportation through brush or in a saddle scabbard.

Fifth, to provide a bolt and firing pin lock mechanism in which movement of the firing pin lock to firing position automatically moves the bolt lock to unlocked position. Sixth, to provide a firing pin lock for a Mauser type gun action which is extremely simple and silent in operation and which is relatively inexpensive to incorporate in the bolt assembly either as initial construction or as an attachment to existing guns.

Other objects and advantages of the invention will be apparent from a consideration of the following description and claims. The drawings, of which there is one sheet, illustrate a highly practical form of the safety mechanism.

Fig. 1 is a fragmentary side elevational view of the rear end of the receiver of a Mauser type rifle action with the bolt having the safety mechanism of the invention assembled in the receiver in cocked firing position.

Fig. 2 is an enlarged fragmentary rear elevational 55 view of the receiver and bolt with the safety in first intermediate locked position.

Fig. 3 is a fragmentary transverse cross sectional view through the bolt and safety taken along the plane of the line 3-3 in Fig. 4 with the safety in a first or intermediate locked position corresponding to the position shown in Fig. 2.

Fig. 4 is a fragmentary top plan view of the receiver and bolt partially broken away in horizontal section along the plane of the broken line 4-4 in Fig. 2 and showing 2

the safety in double safe locked position with the bolt locked in the receiver.

Fig. 5 is a fragmentary transverse cross sectional view taken along the plane of the line 5-5 in Fig. 2.

5 The gun action to which the safety mechanism of the invention is applied is the familiar type of Mauser rifle which is well known so no attempt will be made to disclose or describe in detail the construction of the gun action except as it cooperates with the safety mechanism 10 of the invention. The action includes generally a receiver.

of the invention. The action includes generally a receiver 1 in which the bolt 2 is rotatably and reciprocably mounted for loading and cocking the gun action. The bolt includes the familiar bolt handle 3 that projects rigidly from the right side of the action for rotating the bolt in the receiver to unlock the bolt and cam it rearwardly. Reciprocably mounted within the bolt 2 is a firing pin 4 that is spring pressed forwardly to fire the gun in the well known manner. The rear end of the firing pin 4 carries a depending rib 5 with a notch therein that is engaged by the sear 6 of the trigger mechanism to control the firing of the gun. The rear end of the firing pin 4 is slidably and non-rotatably received in the bolt sleeve 7 which embraces the rear end of the tubular bolt and within which the bolt rotates to effect cocking of the firing pin. The bolt sleeve 7 has a flatted undersurface 8 that non-rotatably engages the rear end of the receiver in the well known manner.

As is standard in Mauser type gun actions the rear end <u>if the firing pin 4 is annularly grooved as at 9 within</u> the bolt sleeve 7 to provide a safety lock shoulder 10. The upper portion of the bolt sleeve 7 is axially bored as at  $\frac{11}{11}$  to receive the bolt lock pin. The standard Mauser bolt lock pin is rotated by a lever on its rear end but in this lock assembly a new bolt lock pin 12 is 35 substituted. projects to the bolt lock button 13 on the rear end of the steeve. The rear end of the bolt 2 as currently The pin 12 is reciprocable in the sleeve and previously manufactured already has a peripheral notch 14 cut therein. In the standard Mauser this notch coacts with the rotary bolt lock pin but in this assembly it registers with the bolt lock pin 12 when the bolt is in closed locked position in the receiver. By pressing forwardly on the bolt lock hutton 13, the pin 12 enters the notch 14 and prevents rotation of the bolt in the receiver and therefore prevents removal of the bolt or cocking of the firing pin. A lock screw 15 prevents rotation of the bolt lock pin 12.

The bolt lock pin 12 cannot control the trigger action or the firing pin and it is possible to fire the gun with the 50 bolt locked unless there is other safety mechanism provided. For this purpose the present invention provides a small solid block of metal 16 that is secured as by the silver solder indicated at 17 along the right side of the bolt sleeve 7. The block 16 and the adjacent portion of the bolt sleeve are transversely bered as at 18 to receive the short safety pin 19 having a rounded inner end projected into the path of the locking shoulder 10 on the firing pin 4 when the firing pin is cocked. In order to selectively control the position of the safety pin 19 the 60 block 16 is vertically bared as at 20 to receive the operating shaft 21 in intersecting relation to the bore 18. The shaft 21 has a cutaway portion 22 forming a broad flat area which when registered with the outer end of the safety pin permits the complete retraction of the safety 85 pin from the firing pin 4 and permits firing of the rifle.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

11

2,824,402

This position of the shaft 21 is the unlocked position of the shaft and the gun action and corresponds to the dotted position 23A of the safety shaft shown in Fig. 4. In order to conveniently rotate the shaft (22) it is provided on its upper end with the arm 23 extending laterally to a depending finger piece 24 that swings along the side of the block 16. The shaft 21 is further provided with a shallow flatted surface 25 which when registered with the safety pin 19 presses the safety pin into the intermediate safe position shown in Eig. 5 in which the firing pin can not be released 10 by the trigger and in which the gun action is in safe condition. The intermediate safe position of the safety and the actuating arm 23 corresponds to the dotted position 23B appearing in Fig. 4. The shallow flat 25 not only locks the safety pin 19 but forms a detent surface that is 15 readily felt in the finger pass 24 as the safety mechanism is rotated to intermediate safe position. The marksman is thus advised that the finger piece has been moved fully from firing position 23A to safe position 23B or vice versa.

In order to interlock the firing pin safety lock with the 20 bolt lock of the action the bolt lock button 13 is provided with a laterally and downwardly inclined interlock pin 26 that projects into the plane of the operating arm 23 of the safety mechanism. The inner end of the operating 25 arm 23 is provided with a concentric arcuate portion 27 that intercepts and prevents forward locking motion of the bolt locking pin 12 and the interlocking pin 26 when the safety mechanism is in off or firing position. The actuating arm 23 is provided with a laterally opening notch 28 that opens to receive the interlock pin 26 when <sup>30</sup> the safety is in intermediate safe position dorresponding to position 23B in Fig. 4. Thus in the bolt closed cocked position of the gun action the safety can be moved to intermediate safe position and the bolt lock member ad-vanced to lock the bolt. In order to further lock the gun 35 action for rough handling or transporting through brush or in a scabbard, the actuating arm 23 and the finger piece 24 can be rotated to a full rearwardly directed position as shown in full lines in Fig. 4 in which case the rear end of the notch 28 will engage and prevent accidental retraction of the bolt lock pin 12. This is the full or double locked position of the safety mechanism. In this full locked position of the safety the rounded portion 29 of the shaft 21 appearing in Fig. 5 engages the outer end of the safety pin 19.

It is pointed out that the action of the actuating arm 23 in moving from either of the locked positions to firing position automatically disengages the bolt lock pin 12 pin 12 because the forward end of the notch 28 cams the interlock pin 26 rearwardly to unlock the bolt as the safety is moved to unlocked firing position. The finger piece 24 of the safety actuating member is conveniently located along side of the bolt sleeve near the bolt operating handle 23 and the trigger mechanism where it can be operated by 55 the thumb of either right or left handed marksmen. The camming action of the flatted surfaces on the shaft 21 provides positive locking movement of the safety pin 19 with a minimum of effort on the part of the marksman. The position of the safety mechanism in all of its adjusted positions is below the top of the bolt sleeve so as not to interfere with any auxiliary sights mounted on the gun action. The position of the safety mechanism also balances the appearance of the bolt sleeve by occupying the area opposite the housing for the spring 30 that presses 65 the locking pin 31 of the bolt sleeve forwardly into engagement with the rear end of the bolt to non-rotatably lock the sleeve to the bolt as is familiar in the Mauser type of bolt. The safety operating shaft 21 is retained in the block 16 by a lock screw 32 threaded through the 70 rear of the block into the groove 33 in the lower end of the shaft.

Having thus described the invention, what is claimed as new and is desired to be secured by Letters Patent is: 1. A safety mechanism for a fire arm of the Mauser

type having a bolt slidably and rotatably mounted in a <sup>75</sup>

1

receiver and a firing pin reciprocably mounted within the bolt with a bolt sleeve positioned around the rear of the bolt and non-rotatably engaged with the receiver, said safety mechanism comprising a block fixedly secured as an attachment to the side of said bolt sleeve, a safety locking pin extending through the side of said sleeve and having its outer end received in a transverse bore in said block, an upright bore in said block intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end of said pin, a retaining screw threaded in said block and engaged in a groove in said shaft, said shaft having a cutaway portion permitting retraction of said safety pin from the inside of said sleeve and a flatted portion engageable with the end of said pin in the intermediate safe position of said shaft to project said safety pin into said sleeve, said firing pin having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, an arm secured to the top of said shaft and projecting laterally to a downturned finger piece at the side of said block, said bolt having a notch in the periphery of its rear end located within said sleeve, a bolt lock pin reciprocally and non-rotatably mounted in said sleeve and projecting from the rear end of the sleeve, said bolt lock pin being receivable in said notch in the locked position of said bolt, and an interlock pin projecting from the rear end of said bolt lock pin into the path of the arm on said shaft, said arm having a rounded inner end cammingly engageable with said interlock pin to retract said bolt lock pin when said arm and said finger piece are moved forwardly to register the cutaway portion on said shaft with said safety pin to condition the mechanism for firing, said arm having a notch adjacent said rounded end receiving said interlock pin when said arm and finger piece are rotated rearwardly to prevent retraction of said bolt locking pin from bolt locking position when said shaft is in a double safe position rotated rearwardly from said intermediate safe position with a rounded portion of its surface engaged with the outer end of said safety pin and holding it in locking engage-

ment with said firing pin. 2. A safety mechanism for a fire arm of the Mauser type having a bolt slidably and rotatably mounted in a receiver and a firing pin reciprocably mounted within the bolt with a bolt sleeve positioned around the rear of the bolt and non-rotatably engaged with the receiver, said afety mechanism comprising a block fixedly secured to the side of said bolt sleeve, a safety locking pin extending through the side of said sleeve and having its outer end received in a transverse bore in said block, an upright bore in said block intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end of said pin, said shaft having a cutaway portion permitting retraction of said safety pin from the inside of said sleeve and a flatted portion engageable with the end of said pin in the intermediate safe position of said shaft to project said safety pin into said sleeve, said firing pin having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, an arm secured to the top of said shaft and projecting laterally to a finger piece at the side of said block, said bolt having a notch in the periphery of its rear end located within said sleeve, a bolt lock pin reciprocally and non-rotatably mounted in said sleeve and projecting from the rear end of the sleeve, said bolt, lock pin being receivable in said notch in the locked position of said bolt, and an interlock pin projecting from the rear end of said bolt lock pin into the path of the arm on said shaft, said arm having an inner end cammingly engageable with said interlock pin to retract said bolt lock pin when said arm and said finger piece are moved forwardly to register the cutaway portion on said shaft with said safety pin to condition the mechanism for firing, said arm having a notch adjacent said end re ceiving said interlock pin when said arm and finger piece

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

are rotated rearwardly to prevent retraction of said bolt locking pin from bolt locking position when said shaft is in a double safe position rotated rearwardly from said intermediate safe position with a portion of its surface engaged with the outer end of said safety pin and holding it in locking engagement with said firing pin.

3 A safety mechanism for a fire arm of the Mauser type having a bolt slidably and rotatably mounted in a receiver and a firing pin reciprocably mounted within the bolt with a bolt sleeve positioned around the rear of the 10 bolt and non-rotatably engaged with the receiver, said safety mechanism comprising a block on the side of said bolt sleeve, a safety locking pin extending through the side of said sleeve and having its outer end received in a transverse bore in said block, an upright bore in said 15 block intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end of said safety pin, said shaft having a cutaway portion permitting retraction of said pin from the inside of said sleeve and a flatted portion engageable with the end of 20 said safety pin in the safe position of said shaft to project said pin into said sleeve, said firing pin having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, an arm secured to the top of said shaft and projecting laterally to a finger piece 25 at the side of said block, said bolt having a notch in the periphery of its rear end located within said sleeve, a bolt lock pin reciprocally and non-rotatably mounted in said sleeve and projecting from the rear end of the sleeve, said bolt lock pin being receivable in said notch in the 30 locked position of said bolt, and an interlock pin projecting from the rear end of said bolt lock pin into the path of the arm on said shaft, said arm having a notch therein receiving said interlock pin when said arm and finger piece are rotated rearwardly to prevent retraction of said 35 bolt locking pin from bolt locking position when said shaft is in double safe position with a portion of its surface engaged with the outer end of said safety pin and holding said safety pin in firing pin locking position.

4. A safety mechanism for a fire arm of the Mauser type having a bolt slidably and rotatably mounted in, receiver and a firing pin reciprocably mounted within ( bolt with a bolt sleeve positioned around the rear of the bolt and non-rotatably engaged with the receiver, /said safety mechanism comprising a block on the side of said 4.5 bolt sleeve, a safety locking pin extending through the side of said sleeve and having its outer end received in a transverse bore in said block, an upright bore in said block intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end 50of said safety pin, said shaft having a cutaway portion permitting retraction of said safety pin from the inside of said sleeve and a portion engageable with the end of said pin in the safe position of said shaft to project said pin into said sleeve, said firing pin having a safety groove 55 the end of which is engaged with said safety pin in the safe position of the pins, an arm secured to the end of said shaft and projecting laterally to a finger piece at the side of said block, said bolt having a notch in the periphery of its rear end located within said sleeve, a bolt lock pin reciprocally and non-rotatably mounted in said sleeve and projecting from the rear end of the sleeve, said bolt lock pin being receivable in said notch in the locked position of said bolt, and an interlock pin projecting from the rear end of said bolt lock pin into the path 65 of the arm on said shaft, said arm having a notch therein receiving said interlock pin when said arm and finger piece are rotated rearwardly to prevent retraction of said bolt locking pin from bolt locking position when said shaft is in double safe position with a portion of its sur- 70 face engaged with the outer end of said safety pin and holding said safety pin in firing pin locking position.

5. A safety mechanism for a fire arm of the Mauser type having a bolt slidably and rotatably mounted within the bolt with a bolt sleeve positioned around the rear of 75 engageable in an intermediate rotated safe position with

the bolt and firing pin and non-rotatably engaged with the receiver, said safety mechanism comprising a safety locking pin extending through the side of said sleeve and having its outer end received in a transverse bore in said sleeve, an upright bore intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end of said safety pin, said shaft having a cutaway portion permitting retraction of said safety pin from the inside of said sleeve and a flatted portion engageable with the end of said pin in the safe position of said shaft to project said pin into said sleeve, said firing pin having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, an arm secured to said shaft and projecting laterally to a finger piece at the side of said sleeve, a bolt lock in said sleeve and engageable with said bolt in the locked position of said bolt, and an interlock member on said bolt lock extending into the path of the arm on said shaft, said arm having a first portion cammingly engageable with said interlock member to retract said bolt lock when said arm and said finger piece are moved forwardly to register the cutaway portion on said shaft with said safety pin to condition the mechanism for firing, said arm having a second portion locking said interlock in bolt locking position when said arm and finger piece are rotated rearwardly to double safe position with another portion of its surface engaged with the outer end of said safety pin to hold said safety pin in firing pin locking position.

6. A safety mechanism for a fire arm of the Mauser type having a bolt slidably and rotatably mounted within the bolt with a bolt sleeve positioned around the rear of the bolt and firing pin and non-rotatably engaged with the receiver, said safety mechanism comprising a safety locking pin extending through the side of said sleeve and having its outer end received in a transverse bore in said sleeve, an upright bore intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end of said safety pin, said shaft having a cutaway portion permitting retraction of said safety pin from the inside of said sleeve and a portion engageable with the end of said pin in the safe position of said shaft to project said pin into said sleeve, said firing pin having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, an arm secured to said shaft and projecting laterally to a finger piece at the side of said sleeve, a bolt lock in said sleeve and engageable with said bolt in the locked position said bolt, and an interlock member on said bolt lock stending into the path of the arm on said shaft, said arm having a first portion cammingly engageable with said interlock member to retract said bolt lock when said arm and said finger piece are moved to register the cutaway portion on said shaft with said safety pin to condition the mechanism for firing, said arm having a second portion locking said interlock in bolt locking position when said arm and finger piece are rotated to safe position with another portion of its surface engaged with the outer end of said safety pin to hold said safety pin in firing pin locking position.

7. In a fire arm having a bolt rotatable between locked firing position and unlocked retractable position and a firing pin reciprocable in said bolt and spring pressed forwardly to firing position, safety mechanism comprising a sleeve non-rotatably mounted on said fire arm around the rear of said bolt and said firing pin, a safety pin mounted in said sleeve in transversely extending relation to said firing pin and projectable into engagement with a shoulder on said firing pin in the safe positions of the pins, an actuating shaft rotatably mounted in said sleeve in transversely extending intersecting relation to the path of said safety pin and in transversely extending off-set relation to the axis of said bolt, said shaft having a first portion cut away to permit retraction of said safety pin firing position and a second intermediate flatted portionengageable in an intermediate rotated safe position with

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

the outer end of said safety pin to advance the safety pin into safe position, said shaft having a third rounded portion engageable with said safety pin in a further rotated double safe position of the shaft to hold said safety pin in safe position, and a finger piece on said shaft to rotate the same, said finger merce on said shaft in the locked position of said finger piece on said shaft in the locked position of said bolt lock and the double safe position of the shaft and said finger piece, said finger piece having a portion cammingly engageable with said bolt lock to move the bolt lock to unlocked position upon rotation of the finger piece to safe position.

8. In a fire arm having a bolt rotatable between locked firing position and unlocked retractable position and a firing pin reciprocable in said holt and spring pressed forwardly to firing position, safety mechanism comprising a sleeve non-rotatably mounted on said fire arm around the rear of said bolt and said firing pin, a safety pin mounted in said sleeve and projectable into engagement with a shoulder on said-firing pin in the safe positions of the pins, an actuating shaft rotatably mounted in said sleeve in intersecting relation to the path of said safety pin and in transversely extending off-set relation to the axis of said bolt, caid shaft having a first portion cut away to permit retraction of said safety pin to firing position and a second intermediate flatted portion enggaeable in an intermediate rotated safe position with the outer end of said safety pin to advance the safety pin into safe position, said shaft having a third portion engageable with said safety pin in a further rotated double safe position of the shaft to hold said safety pin in safe position, and a finger piece on said shaft to rotate the same, said fire arm having a bolt lock member interlocked with said shaft in the locked position of said bolt lock and the double safe position of the shaft and said finger piece.

9. In a fire arm having a bolt rotatable between locked firing position and unlocked retractable position and a firing pin reciprocable in said bolt and spring pressed forwardly to firing position, safety mechanism comprising a sleeve non-rotatably mounted on said fire arm around the rear of said bolt and said firing pin, a safety pin mounted in said sleeve in transversely extending relation to said firing pin and projectable into engagement with a shoulder on said firing pin in the safe positions of the pins, an actuating shaft rotatably mounted in said sleeve in transversely extending intersecting relation to the path of said safety pin and in off-set relation to the axis of said bolt, said shaft having a first portion cut away to permit retraction of said safety pin to firing position and a second portion engageable in a rotated safe position with 50the outer end of said safety pin to advance the safety pin into safe position, and a finger piece on said shaft to rotate the same, said fire arm having a bolt lock member, said bolt lock member being blocked from engagement with said bolt by said finger piece on said shaft in the firing 55 position of the shaft and said finger piece, said finger piece having a portion cammingly engageable with said bolt lock to move the bolt lock to unlocked position upon rotation of the finger piece to firing position.

10. In a fire arm having a bolt rotatable between 60 locked firing position and unlocked retractable position and a firing pin reciprocable in said bolt and spring pressed forwardly to firing position, safety mechanism comprising a sleeve non-rotatably mounted on said fire arm around the rear of said bolt and said firing pin, a 65 safety pin mounted in said sleeve in transversely extending relation to said firing pin and projectable into engagement with a shoulder on said firing pin in the safe positions of the pins, an actuating shaft rotatably mounted in said sleeve in transversely extending intersecting 70 relation to the path of said safety pin and in off-set relation to the axis of said bolt, said shaft having a first portion cut away to permit retraction of said safety pin to firing position and a second portion engageable in a rotated safe position with the outer end of said safety 75

pin to advance the safety pin into safe position, and a finger piece on said shaft to rotate the same.

11. In a fire arm having a bolt rotatable between locked firing position and unlocked retractable position and a firing pin reciprocable in said bolt and spring pressed forwardly to firing position, safety mechanism comprising a sleeve non-rotatably mounted on said fire arm around the rear of said bolt and said firing pin, a safety pin mounted in said sleeve in transversely extending re-10 lation to said firing pin and projectable into engagement with a shoulder on said firing pin in the safe positions of the pins, an actuating shaft rotatably mounted in said sleeve in transversely extending intersecting relation to the path of said safety pin and in off-set relation to the axis of said bolt, said shaft having a first portion cut away to permit retraction of said safety pin to firing position and a second portion engageable in a rotated safe position with the outer end of said safety pin to advance the safety pin into safe position, and a 20 finger piece on said shaft to rotate the same, said fire arm having a bolt lock member, said bolt lock member being blocked from engagement with said bolt by said shaft in the firing position of the shaft and said finger piece.

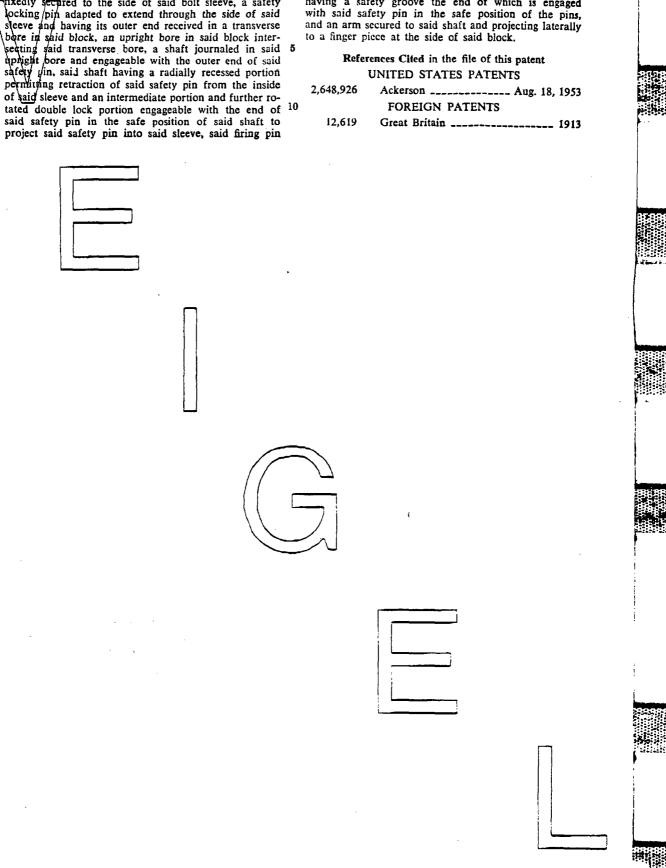

25 12. In a fire arm having a bolt rotatable between locked firing position and unlocked retractable position and a firing pin reciprocable in said bolt and spring pressed forwardly to firing position, safety mechanism comprising a sleeve non-rotatably mounted on said fire arm around the rear of said bolt and said firing pin, a safety pin mounted in said sleeve and projectable into engagement with a shoulder on said firing pin in the safe positions of the pins, an actuating shaft rotatably mounted in said sleeve in transversely extending intersecting relation to the path of said safety pin and in off-set relation to the axis of said bolt, said shaft having a first radially recessed portion to permit retraction of said safety pin to firing position and a second intermediate flatted portion engageable in an intermediate rotated safe position with the outer end of said safety pin to advance the safety pin into safe position, said shaft having a third portion engageable with said safety pin in a further rotated double safe position of the shaft to hold said safety pin in safe position, and a finger piece on said shaft to rotate the same.

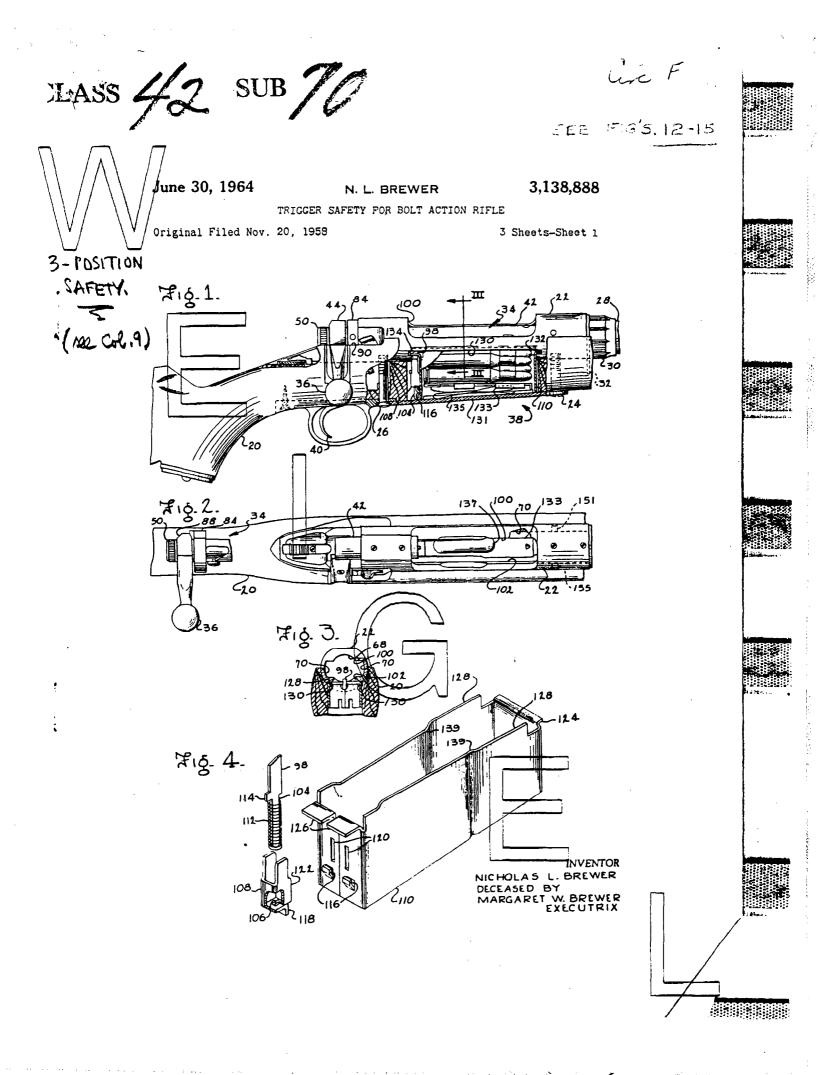

13. A safety attachment for a fire arm of the Mauser type having a bolt slidably and rotatably mounted in a receiver and a firing pin reciprocably mounted within the bolt with a bolt sleeve positioned along the rear of the bolt and non-rotatably engaged with the receiver, said safety attachment comprising a block adapted to be fixedly secured to the side of said bolt sleeve, a safety locking pin adapted to extend through the side of said sleeve and having its outer end received in a transverse bore in said block, an upright bore in said block intersecting said transverse bore, a shaft journaled in said upright bore and engageable with the outer end of said safety pin. a retaining screw threaded in said block and engaged in a groove in said shaft, said shaft having a radially recessed portion permitting retraction of said safety pin from the inside of said sleeve and a flatted portion and further rotated double-lock portion engageable with the end of said safety pin in the safe position of said shaft to project said safety pin into said sleeve, said firing pin having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, and an arm secured to the top of said shaft and projecting laterally to a downturned finger piece at the side of said block.

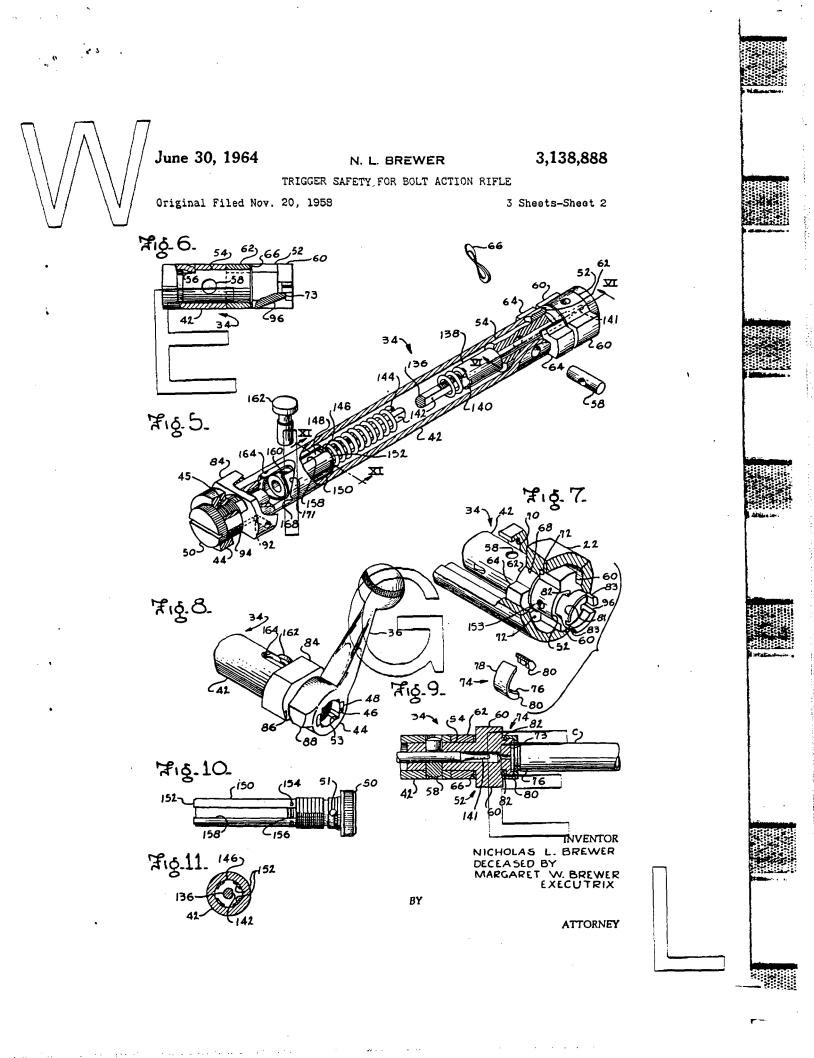

ed in said sleeve in transversely extending intersecting relation to the path of said safety pin and in off-set relation to the axis of said bolt, said shaft having a first portion cut away to permit retraction of said safety pin to firing position and a second portion engageable in a rotated safe position with the outer end of said safety 75 safety attachment comprising a block adapted to be

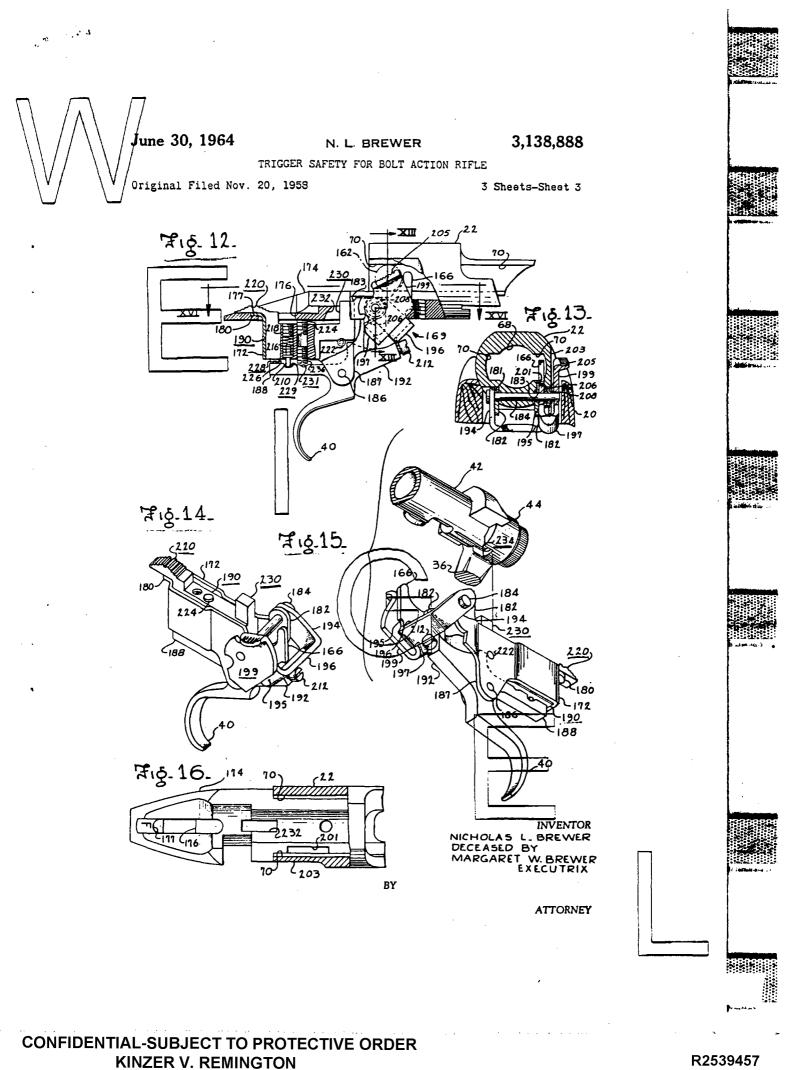

having a safety groove the end of which is engaged with said safety pin in the safe position of the pins, and an arm secured to said shaft and projecting laterally to a finger piece at the side of said block.

FRIGGER SAFETY FOR BOLT ACTION RIFLE Nicholas L. Brewer, deccased, late of Tarpon Springs, Fla., by Margaret W. Brewer, executrix, Tarpon Springs, Fla., assignor, by mesne assignments, to The American Hardware Corporation, a corporation of Connecticut

Original application Nov. 20, 1953, Ser. No. 775,143, now Patent No. 3,005,279, dated Oct. 24, 1961. Divided and this application May 12, 1961, Ser. No. 120,822 9 Claims. (Cl. 42--70)

The present invention relates to improvements in small arms, such as rifles or the like, and in certain aspects finds particular utility in bolt action rifles.

This is a divisional application of applicant's copending 15 application Serial No. 775,143, filed November 20, 1958, now Patent No. 5,005,279, and assigned to Savage Arms Corporation.

The principal object of this invention is to provide im-proved safety mechanism for firearms, such as bolt action rifles and the like

These and related objects of the invention including the novel features by which such ends are obtained will be apparent from the following description of the disclosure found in the accompanying drawings and the particular 25 novelty thereof pointed out in the appended claims.

In the drawings:

FIG. 1 is a side elevation of a receiver and associated parts embodying the present invention with certain por-tions thereof broken away and with the action closed; FIG. 2 is a plan view of the elements seen in FIG. 1

30 with the action open;

FIG. 3 is a fragmentary section taken on line III---III of FIG. 1, with the bolt removed from the receiver and with the shells removed from the magazine;

FIG. 4 is an exploded perspective view, on an enlarged scale, of the magazine and ejector assembly seen in FIG. )

FIG. 5 is a partially exploded perspective view on fan enlarged scale and with portions in section, of the bold seen in FIG. 1; 40

FIG. 6 is a section taken on line VI-VI in FIG. 3 FIG. 7 is a perspective view on a different angle show ing the front end of the bolt seen in FIG. 5 and illustrat ing its relation to the receiver which is shown partially in section and with its extractor in exploded relation;

FIG. 8 is a perspective view, with certain parts removed, showing a different angle of the rear end of the bolt seen in FIG. 5;

FIG. 9 is a longitudinal section showing the front end of the bolt as it would be locked up in the breech prepara- 50 tory to firing the illustrated cartridge;

FIG. 10 is a plan view of certain component parts seen in FIG. 5;

FIG. 11 is a section taken on line XI-XI in FIG. 5;

FIG. 12 is an elevation on an enlarged scale and with 55 certain portions being shown in longitudinal section, of the firing mechanism indicated in FIG. 1;

FIG. 13 is a section taken on line XIII-XIII in FIG. 12;

FIG. 14 is a perspective view of the mechanism seen in  $_{60}$ FIG. 12 detached from the receiver;

FIG. 15 is a perspective view on a different angle of the mechanism shown in FIG. 12 showing an operative relationship with the bolt; and

FIG. 16 is a section taken on line XVI-XVI in FIG. 65 12 showing only the receiver and its tang.

The present invention includes certain aspects which are related to bolt action rifles as well as other novel features having broader utility in the field of small arms as will be apparent to those skilled in the art. FIGS. 1 and 2 70 illustrate the relationship of the various components of a bolt action rifle embodying these inventive features.

2

Thus a rifle stock 20 is grooved to receive the lower portion of a receiver 22 and secured thereto by screws 24. 26 threaded into the receiver. The rifle barrel briefly indicated at 28 is threaded onto the forward end of the receiver with a lock nut 30 clamping a recoil plate 32 against the front face of the receiver 22. The recoil plate 5 32 may be received in a transverse slot formed in the rifle stock 20 so that, if desired, the barrel 28 may be otherwise dissociated from the rifle stock to give a free floating barrel mounting yielding greater accuracy. 10

A bolt 34 is slidably and rotatably mounted in the receiver 22 and may be operated by a handle 36 to carry out the functions normally associated with bolt action rifles. Thus the handle 36 may be raised from the position seen in FIG. 1 to rotate the bolt 34, and cock the firing pin. It may then be retracted (FIG. 2) to withdraw an expended cartridge shell from the firing chamber to automatically eject the shell and then moved forwardly to feed a fresh cartridge from a magazine 38 into the chamber. When the handle 36 is again moved to its lower position, the bolt is locked in the breech of the rifle with the firing pin cocked in position to be released by the trigger 40. The above brief description is provided primarily to give an over-all picture of the rifle in which the present invention is embodied and the various components thereof, as well as its detailed mode of operation, will now be described in detail.

The bolt 34 best seen in FIGS. 5 through 10, and particularly in FIG. 5, comprises an elongated tubular body 42. The bolt handle 36 is provided with a hub 44 (FIGS. 5 and 8) having an inturned flange 45 which seats on the rear end of the tubular bedy 42. The hub 44 is slotted at 45 to receive diametrically opposed projections 48 extending from the rear end of the tubular body 42, thereby angularly positioning the handle 36 with respect to the tubular body 42. A screw 50 is threaded into the rear erd of the tubular body 42 to secure the handle 36 in place. Ball detents 51 (FIG. 10) engage grooves 53 in the hub 44 (FIG. 8) to prevent loosening of the screw 50 when the rifle is in use and yet permit easy manual dissembly of the screw 50 without the need for special hand tools.

A bolt head 52 is disposed at the front end of the tubular body 42 and has a reduced diameter 54 (FIGS. 5 and 6) telescopically received within the front end of the tubular body 42. The bolt head 52 is angularly positioned by a projection 56 struck from the upper surface of the body 42 (FIG. 6) and received by a notch formed on the inner end of the reduced diameter 54. A locking pin or cross pin 58 secures the bolt head in place on the front end of the body 42. It will be seen that oppositely extending lock lugs 60 project from the fore portion of the bolt head 52. A front baffle 62 is rotatably mounted on the reduced diameter 54 between the front end of the body 42 and the lock lugs 60 and further has oppositely extending baffle lugs 64 projecting therefrom, the baffle lugs 64 having the same general cross section as the lock lugs 60. It will also be noted that a spring friction washer 66 (FIG. 9) is disposed between the front baffle 62 and the bolt head 52 to urge the latter forwardly and thereby maintain the pin 58 in place and also to prevent the free relative rotation between the lugs 64 and the lugs 60, that is, the lugs 64 will be held from turning out of line with lugs 60 by themselves when outside rcceiver.

The bolt 34, as thus far described, is slidingly received within a bore 68 (FIG. 3) extending lengthwise of the receiver 22, while horizontally disposed channels 70, opening outwardly of the bore 68, slidingly receive the lugs 64 and 66. The channels 70 terminate (FIG. 7) at the forwardmost position of the lock lugs 60 and the front end of the receiver is counterbored to form locking shoul-

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

5

ders 72 (FIG\_7) which are angularly disposed to the channels 70. (With this arrangement the bolt 34 is locked in the breech/by moving the bolt to its forwardmost position and then rotating the handle 36 from upper position to its lower/position and thus bringing the lock lugs 60 into engagement with the shoulders 72, thereby locking the bolt. It will also be noted that when the bolt is so rotated the baffle lugs 64 are captured in the channels 70and their position relative to the receiver remains un-changed. This relationship of lugs 60 and 64 also in- 10 volves the baffling of gases as in the event of a ruptured

cartridge, all as will be later dealt with in greater detail. After firing a shell, the bolt handle is raised to return the locking lugs 60 into alignment with channels 70 preparatory to retracting the bolt and extracting the ex- 15 pended cartridge casing from the firing chamber. The relationship of the bolt need to the cartridge casing is best appreciated from F.G. 9 wherein it will be seen that the forward end face of the bolt head is counterbored at 73 to receive the grooved end of the cartridge case c. An 20 extractor 74 is mounted on the forward end of the bolt head 52 and includes a lip or hook 76 (see also FIG. 7) which engages the conventional groove formed in the grooved end of the casing c. More particularly, the extractor comprises a split spring band or clip having a rela- 25 tively thin annular section 78 (FIG. 7) with grooved retaining lugs 80 at either extremity, the hook 76 extending from one of the retaining lugs 80. The forward end of the bolt head is relieved at 81 (FIG. 7) to receive the annular extractor section 78 with grooves 82 (FIGS. 7 30 and 9) being provided to receive the rear portions of the retaining lugs 80, thereby positively positioning the extractor 74 relative to the bolt head 52 in an axial sense. This mounting arrangement further permits the spring band to be expanded as the retaining lugs 80 are snapped 35 into notches 83 in the front face of the bolt head 52 with the lip or hook 76 projecting into the counterbore 73. The extractor 74 thus yieldingly hooks the rear end of a cartridge casing and is free to be deflected when the end of a cartridge case is inserted or ejected from the counter- 40 bore 73. It will be appreciated that the extractor is simple to manufacture, requires a very minimum of space and may be easily removed simply by springing one of the other of the retaining lugs 80 out of the notch or recess 83 formed in the end of the bolt head.

The extractor 74 thus releasably grips the cartridge by the hook 76 and after firing, the bolt handle is rotated to its upper position preparatory to withdrawing and ejecting the casing. On firing the cartridge the casing will expand in the chamber and cam means are provided for positively camming the bolt rearwardly to initially free the casing from the chamber. These means comprise a member 84 rotatably and slidably mounted on the bolt body 42 between the bolt handle hub 44 and the rear end of the receiver 22 (FIGS. 1 and 8). Member 84 also serves as a rear gas baffle, as is later explained, and further includes a cam face 86 which is engaged by a projection 88 extending from the handle hub 44. In the last part of the upward movement of the bolt handle 36 the projection 88 engages the cam surface 86 and positively displaces the bolt 34 rearwardly thereby drawing with it the expended cartridge casing which is gripped by the lip or hook 76. It will be noted the extractor 74 is in the counterbore end of the barrel at this point and is thereby prevented from expanding as the casing is forcibly re-65 moved by this camming action. The bolt may then be fully retracted and the shell casing carried rearwardly to the ejector mechanism for automatically kicking the expended shell casing from the receiver.

Reverting back to member 84, it will be seen that it is 70 somewhat greater than semi-circular in cross section with its lower ends resting upon shoulders 90 (FIG. 1) formed adjacent the rear end of the receiver 22. The member 84 is normally maintained in a given angular relationship

detent 92 (FIG. 5) riding in a longitudinal groove 94 formed in the tubular body 42. This detent arrangement permits the bolt body to be rotated relative to the member 84 when the bolt handle 36 is moved to its lower position to lock the bolt in the breech of the rifle.

Referring next to FIG. 6, it will be seen that a tapered slot 96 is cut in the lower front end of the bolt head 52 and enters the bottom of the counterbore 73. Upon retraction of the bolt 34, the slot 96 is in aligned relation with a stamped sheet metal ejector 98 (FIGS. 1 and 3) which is spring urged upwardly. As the bolt nears full retraction, the ejector 98 enters slot or groove 96 and the rear end of the casing will forcibly strike the forward face of the ejector 98, thereby kicking the casing out through an ejection port or cut-a-way 100 intermediate the ends of the receiver. It will be noted that the lip 76 (FIG. 7) is generally aligned with the port 100 so that as the rear end of the casing strikes the ejector 98 it will be thrown laterally through the port 100 in a low arc.

The ejector 98 is disposed towards the rear of a bottom or lower opening 102 formed in the receiver 22 and is provided with an integral depending tail 104 which is guidingly received by a slot 106 formed in an ejector housing 108 (see also FIG. 4). The upper end of the ejector 98 slidingly engages the rear wall of a magazine box 110 and the rear wall of the receiver opening 102. A spring 112 is captured between the bottom wall of housing 108 and a projection 114 extending rearwardly of the extractor 98. This arrangement provides for vertical reciprocating movement of the ejector 98 allowing it to move upwardly into the slot 96 of the bolt head 52 upon retraction of the bolt and to thereby eject the expended casing. The extractor is thereafter cammed downwardly as the bolt is again moved forwardly to feed another shell from magazine 38 into the firing chamber.

Referring now to the magazine 38 it will be seen that it comprises the magazine box 110 which is a sheet metal stamping bent into a rectangular configuration with the ends of the stamping meeting in abutting relation along vertical line intermediate the width of the rear wall of the magazine box as is best seen in FIG. 4. A pair of tabs or lips 116 project outwardly from the rear wall of the magazine box and receive a downbent tab 118 extending from the ejector housing 108. The rear wall of the magazine box is also slotted at 120 to receive projections 122 extending from the walls of housing 108 to prevent the rear wall of the magazine 110 from spreading. It will also be noted that a lip 124 projects forwardly from the front wall of box 110 and lips 126 project rearwardly

from the rear wall of the box. The lips 126 are spaced apart to permit passage of the ejector 98 therebetween and further guide said ejector. The lips 124, 126 are both spaced below the upper-side edges 128 of said box, so that box 110 may preferably be mounted on receiver 22 by forming ledges 130 (FIGS. 1 and 3) longitudinally of the bottom opening 102 and opposed horizontal slots 132, 134 spaced downwardly from the ledges 130 at the forward and rear ends of the opening 102. With this arrangement, the magazine box 110 may be assembled on the 60 receiver 22 by inserting the lips 126 fully into the slot 134 engaging the upper box edges 128 with the ledges 130 and then shifting the box forwardly a distance sufficient to introduce the lip 124 into the slot 132 and against the forward end of the receiver opening 102. The housing 108 with the ejector 98 and spring 112 assembled thereon is then inserted between the rear end of the box 110 and the forward end of the bottom opening 102 with the pro-jections 122 entering the slots 120. Thus lips 124 and 126 are caught in the slots 132 and 134 respectively and cannot be removed without dismantling the housing 108.

It will be appreciated that while the combination mounting of the ejector 98, its housing 108 and the magazine box 110 have certain unique cooperative relationships, Lit would be possible to attain advantages by mounting either with the bolt body 42 by means of a spring pressed ball 75 one or the other in the manner described, utilizing the

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

necessary functions attributable to each and yet by either using some other form of ejector mechanism or using some other means for mounting the magazine box.

5

As/can be seen from FIG. 1 the magazine box 110 is disposed within a central opening through the rifle stock 20. / A base plate 131 covers over the bottom of this opening/and is held in place by the screws 24, 26. A follower plate 133 is urged upwardly from the base plate 131 by a spring 135. This arrangement, as illustrated, permits cartridges to be loaded through the upper and lower ports 10 100 and 102 into the magazine 38 in staggered relationship. The follower plate 133 is provided with an off-set projection 137 (FIG. 2) which insures that the cartridges will be caught on one side or the other of the bottom opening 102 (see FIG. 3) and not be fed loosely from 15 the magazine 38. The cartridges project upwardly a sufficient distance so that upon full retraction of the bolt 34 the rear end of the uppermost cartridge is picked up for projection by the holt 34 centrally from the magazine and then carried into the firing chamber as the bolt is moved forward. It will be seen that the inbent ridges 139 are formed on the side walls of the magazine box 110 to engage the forward shoulders of the cartridge casings to prevent shucking of the cartridges and consequent damage to the tips of the bullets.

The firing mechanism for the present invention is uniquely simple and comprises a firing pin 136 (FIG. 5) centrally disposed within the tubular bolt body 32 and projecting through a central bore of the bolt head 52. A firing pin stop nut or stop piece 138 is threaded on the forward end of the firing pin 136 and is engageable with the rear end of the reduced bolt head diameter 54 to limit the protrusion of the forward end or point 141 of the firing pin 136 beyond the counterbore 73. The point 141 of the firing pin 136 is best seen in its cocked position in FIG. 9, wherein it can also be seen that the bore in the outermost end of the bolt head closely approximates the diameter of the point of the firing pin to minimize the amount of gas which may be blown rearwardiy through the bolt body 42. As has been noted, the stop piece 138 controls the extent of firing pin protrysion, this being established by threading the stop piece 138 to the appropriate axial position on the firing pin 136.

A lock washer 140 (FIG. 5) maintains the stop piece 138 in adjusted position. More particularly, the lock washer 140 is formed with a central opening having a straight edge which non-rotatably engages a lat 142 formed lengthwise of the firing pin 136 and has spurs projecting outwardly and received in notches formed in the rear end of the stop piece 138.

A main spring 144 is coiled about an intermediate length of the firing pin 136 and is seated at its forward end on the lock washer 140 and at its other end on a washer 146 which is axially positioned on the firing pin 136 by a cocking piece 148 threaded on the rear end thereof to preload the spring 144. The washer 146 is also non-rotatably mounted on the firing pin 136 by reason of a central hole having a straight edge (FIG. 11) engaging the flat 142. A sleeve 150 slidably surrounds the cocking piece 148 (FIG. 5) and is provided with projections 152 (FIG. 11) at its forward end which interdigitate with spurs extending outwardly of the washer The sleeve 150 (FIG. 10) at its rear end butts 146. against a shoulder formed on the assembly screw 50 and is rotatably mounted thereon by means of indentations as at 154 which engage a peripheral groove 156 formed in the forward end of the screw 50. The sleeve 150 is provided with a lengthwise slot 158 having a width somewhat less than the diameter of a transverse hole 150 formed adjacent the rear end of the cocking piece 148. A cocking pin 162 (FIG. 8) is disposed within the hole 163 (FIG. 5) and retained therein by the marginal edges of the sleeve slot 158 embracing a necked portion ad-jacent the head of the pin 162. The head of cocking pin 162 is disposed adjacent the outer surface of the bolt 75

6 body 42 passing through a cam opening 164 formed therein.

With this arrangement of parts, the firing pin may be cocked and fired in the following fashion. From FIG. 12 it will be seen that the head of the cocking pin 162, in the forward position of the bolt is disposed within the rear of receiver 22, entering into the near channel 70. A sear lever 166 projects upwardly into the near channel 70 (see also FIG. 13) in obstructive relation to further forward movement of the cocking pin 162, and is integrally formed on a sear 169 to be later described in detail.

Normally the firing pin 141 is held in a retracted or cocked position by reason of spring 144 being compressed and held by the cocking pin resting in a notch 168 (FIG. 5) formed adjacent the rear end of the cam opening 164. In this position of the cocking pin 162 the cocking piece 148 and striker 136 are of course retracted while the spring 146 is compressed since the washer 146 is held relatively stationary by the sleeve 150. The above describes the relative disposition of the cocking pin 162 and related parts as the bolt 34 is moved forwardly to close the action of the rifle. After the action is closed, the boit handle 36 is lowered to locked position as above described. In so lowering the handle 36, the bolt body 25 42 is rotated relative to the receiver 22 while the cocking pin remains relatively stationary being captured in the channel 70. The cocking pin 162 is thus held in cocked position at the rear of the greatest lengthwise extent of the opening 164 and the rifle is in readiness to be fired. Finger pressure on the trigger 49 will release the sear 169, in a manner later described, allowing the sear lever to swing downwardly out of the path of forward movement of the cocking pin 162 thereby permitting the firing pin to percussively strike the cartridge in the firing chamber under 35 the influence of main spring 144. It will be noted that the cocking piece 143 is axially adjusted on the firing pin 136 to prevent the cocking pin 162 from striking the forward end of the opening 165.

After the rifle has thus been fired the bolt handle 36 raised to its upper position thereby rotating the tubular bolt body 42 relative to the cocking pin 162. During this rotation the angularly confined pin 162 is displaced rearardly by cam surface 171 (FIG. 5) of the opening 164 thereby camming the cocking pin 152 and with it the firing pin 136 rearwardly and reseating the cocking pin 162 in the notch 168. Spring means, later described, return the sear lever 166 to the position illustrated in FIG. 12 and the firing cycle just described may be repeated after retraction of the bolt 34 to eject an expended cartridge casing and return movement of the bolt to feed a fresh cartridge into the chamber.

The bolt and firing pin assembly above described comprise parts which may be readily fabricated primarily by screw machine operations and by sheet metal stampings. Their assembly in the original manufacture of the rifle as well as their disassembly for repair or adjustment is extremely simple and convenient. Disassembly involves merely the removal of screw 50 together with sleeve 150, removal of cocking pin 162, withdrawal of the firing pin 136 and removal of the pin 58 to take down the com-ponent parts of bolt 34. The main spring 144 may be removed by threading the cocking piece 143 off the rear end of firing pin 135. Adjustment of the extent of protrusion of the point 141 of the firing pin, may be made 65 by telescoping the bolt head 52 over the point 141 in abutting relation with the stop piece 138. With lockwasher 140 removed, stop piece 138 may be varied axially of firing pin 136 to obtain the desired extension of point 141 beyond the inner face of counterbore 73. The ex-70 tent of protrusion may be gauged by the sleeve 150 (FIG. 10). With the extractor 74 removed the sleeve projections 152 may be brought against the counterbore 73 on either side of the firing pin 141 and the amount of protrusion set to match the height of the projections 152

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

R2539460

.

which height is in fact the preferred distance for protrusion of the firing pin.

Normally when a cartridge is discharged its casing is expanded into sealing contact with the walls of the firing chamber preventing rearward escape of gases so that at least substantially all of the gases are propelled outwardly through the barrel of the rifle. However, in the case of an ineffective seal or rupturing of the cartridge casing, gases may blow back rearwardly of the firing chamber past the boit head 52 which is locked in the breech of 10 the firing chamber. In order that gases may not injure the user of the rifle, various ports and baffles are provided to deflect such gases laterally of the receiver. In FIG. 7, the tapered slot 96, when the bolt head is locked, is disposed to provide communication for the forward end of 15 the bolt head 52 with a lateral hole 151 formed in the receiver 22 forward of the channel 70 (FIG. 2). The slot 96 thus provides conduit means for conducting gases from the rifle chamber to a predetermined location in the receiver. It will be noted that the baffle lug 64 is aligned 20 with the slot 96 and the port 151 for deflecting gases outwardly through the port 151. This will effectively mini-mize the passage of sascs rearwardly of the front baffle. What little gas may pass between the bolt and receiver is throttled as it enters the opening 100 thereby safely dis- 25 sipating its effect.

There may also be a possibility of gases passing through the firing pin hole opening of the counterbore 73 (FIG. 9). Such gases would pass interiorly of the bolt head and then be vented for the most part through a port 153 (FIG. 7) communicating with the interior  $\phi f$  said bolt and aligned with a port 155 (FIG. 2) formed in the receiver 22. The firing pin hole and port 153 provide conduit means for conducting gases from the rifle chamber to a predetermined location in the receiver. The baffle lug 64 is aligned with the ports 153 and 155 for deflecting gases outwardly of the receiver through the port 155. This effectively minimizes the passage of gases rearwardly of the baffle. There is also a possibility that some gases will pass rearwardly through the bolt body 42 and escape through the cam opening 164 which in the firing position of the bolt is enclosed within the rear end of the received 22. In order to prevent gases from escaping from the rear of the receiver 22 adjacent the eye of the shooter, member 84 is arranged to serve as a baffle member and is positioned at the rear end of the receiver to insure lateral deflection of such gases. This position of the member 84 is automatically provided for by the manner in which it is mounted on the bolt body 42. As has been noted, the member 84 is rotatable on the body 42 and as can be seen, is also axially slidable thereon. Thus, in the primary ejection of an expended cartridge the member 84 will be firmly seated against the rear face of receiver 22 when projection 88 (FIG. 8) engages cam surface 86 as previously described. This position of member 84 is also 55 assumed when the action is locked, as indicated in FIG. 1.

The rear baffle is free to slide forwardly and rearwardly slightly so that pressure of escaping gas will move it backward if necessary to escape.

The sear 169 and trigger 40 also embody certain novel <sup>60</sup> features which will be apparent from the following detailed description of their construction and operation with particular reference being had to FIGS. 12–16.

A U-shaped trigger mounting bracket 172 is secured beneath a tang 174 extending rearwardly of the receiver 22. 65 More particularly the bracket 172 comprises a sheet metal stamping having its bridge vertically disposed towards the rear of tang 174. A tab 180 is bent rearwardly from the upper edge of the bridge of bracket 172 and is received in an appropriate recess 177 (FIGS. 12 and 16) formed 70 adjacent the rear end of a slot 176 extending through the rear portion of tang 174. Recesses 181, 183 (FIG. 13) are formed on opposite sides of the lower surface of the receiver 22 and provide vertical faces which are embraced by ears 182 extending upwardly from the front 75

ends of the arms of bracket 172. A pin 184 extends through the ears 182 and the embraced portion of receiver 22 to secure the front end of bracket 172 thereto with its upper edges engaging the lower surface of tang 174 and its rear end retained in place by tab 180. The pin 184 is thus the single fastening element for the trigger mounting bracket 172.

The trigger 40 is pivotally mounted on a pin 186 extending between depending ears 187 (FIGS. 12 and 15) of the bracket 172. The trigger 40 comprises, as can be seen, a rearwardly extending leg 188 which is cooperatively disposed relative to a safety member 190, later described in detail, and a forwardly extending leg 192 which is disposed in cooperative relationship with the sear 169.

The scar 169 is bent from a single piece of sheet metal and comprises two U-shaped portions one of which includes a bridge 196 (FIGS. 14 and 15) and arms 194, 195 embracing the bracket ears 182 (FIG. 13) and pivotally mounted on the pin 184. The second U-shaped portion comprises a second bridge 197 interconnecting the arm 195 with a third outwardly spaced arm 199.

The sear lever 166 is formed as an integral extension of the sear arm 195 and projects through slot 201 into channel 70 (FIGS. 13 and 16) to cooperate with the cocking pin 162 as above described. The sear arm 199 extends upwardly receiving the unheaded end of pin 184, and extending above the stock 20 (FIG. 13) adjacent a relieved portion 203 of the receiver 22. The upper end of arm 199 is outbent to provide a visual indicator 205 which may readily be checked when the action is closed to determine whether or nor the firing pin is cocked. That is, when the firing pin is cocked the indicator 205 is in its upper position seen in FIG. 12, and after the gun has been fired, forward movement of the cocking pin 162 depresses the sear lever 166 into slot 291 and rotates the sear 169 bringing the indicator 205 to a lower horizontal position.

A torsion spring 206 (FIGS. 12 and 13) is disposed between the sear arms 195, 199, being concentrically positioned on the pin 184 by a bushing 208. The free ends of the torsion spring 206 respectively bear against the rear surface of receiver recess 183 and the upper end of the bridge 197 to urge the sear 169 in a counterclockwise direction (FIG. 12) and thus return the cocking lever 166 to its unright position when the firing pin is cocked by manipulation of the bolt handle 36 as above described. The scar 169 is latched in what may be termed its cocked position by the lower knife edge of the bridge 196 bearing against the forward face of the trigger leg 192. It will be seen that a spring loaded plunger 210 (FIG. 12) bears against the trigger leg 138 to urge the trigger leg 192 into obstructive relation with the sear bridge 196. When the action is closed and the bolt locked in the receiver, the head of cocking pin 162 will engage the sear lever 166 and under the influence of main spring 144 tend to rotate the sear in a clockwise direction (FIG. 12) bring-ing the knife edge of bridge-196 into firm engagement with the forward face of trigger leg 192. The extent of this engagement is adjustably controlled by a screw 212 threaded into the outer end of leg 192. It will be apparent that if the screw 212 were threaded further inwardly of the leg 192 the bridge 196 would be disposed nearer the upper edge of the leg 192 and conversely if the screw 212 were threaded outwardly the spring loaded plunger 210 would rotate the trigger to space the knife edge of bridge 196 further from the upper edge of the leg 192. In this manner the extent of trigger travel necessary to release the cocking pin 162 may be controlled to suit the needs of the user of the gun.

The spring loaded plunger 210 is mounted on the safety member 190 which is longitudinally slidable between the arms of the trigger bracket 172.

13) are formed on opposite sides of the lower surface of the receiver 22 and provide vertical faces which are embraced by ears 182 extending upwardly from the front 75 of an upward projection from the safety member 190 and

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

projecting upwardly through the tank slot 176. The thumb piece 220 (FIG. 12) slidably engages the upper surface of tang 174 to provide the rear bearing point for the safety member 190. A pin 222 extends between the arms of bracket 172 and slidingly supports a forward 5 horizontal undersurface of the safety member 190. An adjustable intermediate bearing point for the safety member is provided by an upwardly projecting screw 224 which is threaded into the safety member 190 and bears against the lower surface of tank 174.

Various surfaces formed on the trigger leg 188 cooperate with the safety member 190 as will now be described. A raised land 225 is formed at the rear of leg 188 beneath a screw 228 projecting from the safety member 190. When the safety member is in the "safe" position illus-15 trated in FIG. 12, the screw 228 is in obstructive relation with land 226 thereby preventing any rotation of the trigger 40 sufficient to bring the leg 192 out of obstructive relation with the sear bridge 196, which in turn prevents release of the cocking pin 162 and discharge of the piece. 20 The safety member is also arranged to lock the bolt 34 so that the action cannot be inadvertently opened when the gun is in <u>"safe" condition</u>. This is attained by an upstanding lug 230 projecting from the forward end of the safety member 190 through a second tank slot 232 (FIGS. 12 and 16) spaced forwardly of the slot 176. The bolt handle hub 44 is notched at 234 (FIG. 15) to receive the lug 230 when the bolt handle 36 is in its lower position thereby locking the bolt 34 with the action closed. The trigger leg 188 is transversely notched at 229 to 30

The trigger leg 188 is transversely notched at 229 to receive the spring loaded plunger 210 to provide detent means for releasingly maintaining the in its "safe" position.

X

The safety member 190 is displaced forwardly of the notch 229 to a further "safe" position in which the screw 35 228 will still be disposed above the knul 226 preventing releasing movement of the trigger 40 and wherein the lug 230 will be disposed forwardly of the bolt handle hub 44. In this position of the safety member 190 the action may be opened and closed by manipulation of the both handle 36, as, for example, to discharge an expended cartridge casing, or to empty the magazine 38 by reciprocation of bolt 34 without danger of firing the rifle. In the forwardmost or firing position of the safety member the screw 228 is spaced forwardly of the raised 45 land 226 allowing sufficient movement of the trigger 40 to release the sear 169, thereby releasing the firing pin. A second transverse notch 231 is formed in the trigger leg 188 to receive the spring loaded plunger 210 and releasably maintain the safety member 190 in its fir- 50 ing or inoperative position. Travel of the trigger beyond that necessary to bring the leg 192 out of obstructive relationship with the sear bridge 196 may be limited by a screw 236 threaded into the same hole as the screw 224 and projecting from the lower surface of safety mem- 55 ber 190. Thus, immediately upon release of the sear 169 the trigger leg 188 may be arranged to engage the screw 236 thereby minimizing the extent of trigger travel after firing the rifle. The force of trigger pull is primarily controlled by a spring 216, confined by a screw 218, and 60 (FIG. 12) urging the plunger 210 into engagement with the trigger leg 188. The force of spring 216 may be varied by the extent to which screw 218 is threaded into the safety 190. With the safety member 190 in the il-65 lustrated safe position, it will be seen that the upper end of screw 218 is accessible through slot 176 to receive a screw driver whereby the force of spring 216 may be readily adjusted without disassembly of the rifle components.

A further point to be noted is that the sear lever 166 also serves as a bolt stop. That is, when the bolt is retracted, the right hand (FIGS. 5 and 13) baffle lug 64 will engage the sear lever 166 thereby limiting rearward travel of the bolt 34. When it is desired to remove the bolt, 75 terchangeably used for right hand or left hand rifles.

trigger 40 is pulled to drop the trigger leg 192 below sear bridge 196 and then cocking indicator 205 is depressed (see also FIG. 12) to lower cocking lever 166 below the level of channel 70 thereby permitting the bolt 34 to be withdrawn from the receiver 22.

#### Operation

The rifle is loaded by inserting cartridges downwardly into the magazine while the bolt 34 is disposed in its re-10 tracted position. A cartridge is rammed into the firing chamber of the rifle by forward movement of the bolt, lip 76 of the extractor 74 engaging the groove of the cartridge case. As the bolt 34 is moved forwardly in the receiver the cocking pin 162 engages the sear lever 166 (FIG. 12). When the bolt is rotated to its breech closing position, the cocking pin is prevented from rotating by channel 70 of the receiver and is held in its cocked position at the rear of the bolt cam opening 164 (FIGS. 5 and 8) by the sear lever 166. The cocking indicator 205 (FIG. 12) is disposed in its upwardly extending position indicating the cocked condition of the rifle. When the bolt is rotated to its locked position, the lock lugs 60 are carried into engagement with the shoulders 72 in the breech end of the receiver thus locking the bolt in its closed position. The baffle lugs 64 are prevented from rotating by channel 70 and are held thereby in axial alignment rearwardly of the receiver gas escape ports 151 and 155 (FIG. 2) and the slot 96 and port 153 (FIG. 7) on opposite sides of the bolt 34.

The cocking pin 162 is held in its cocked position against the force of the compressed main spring 144 by the sear 169 which is prevented from rotating by the trigger leg 192. As shown in FIG. 12, the plunger 210 urges the trigger leg into its sear engaging position. When the trigger is pulled, the plunger 210 is forced upwardly against spring 216 and the trigger leg 192 is pivoted downwardly releasing the cocking pin 162. The firing pin is thrust forwardly by the main spring 144 firing the round in the chamber and the cocking pin 162 moves the sear lever 166 downwardly out of the channel 70.

In the event of rupture of a cartridge case, escaping gases are deflected outwardly through the gas escape ports by means of the baffle lugs 64. Furthermore, any gas which might escape rearwardly of the baffle lugs will be deflected outwardly by the rear baffle 84.

To discharge the cartridge case after a round is fired, the bolt handle 36 is rotated counterclockwise. Prorection 88 (FIG. 8) of the bolt handle engages the cam face 86 of the rear baffle and the bolt is cammed rearwardly to break the seal of the cartridge case in the chamber.

As the bolt handle <u>36</u> is raised, the cocking pin <u>162</u> is prevented from rotating by channel **70** (FIG. 12) and is displaced rearwardly by the cam surface <u>171</u> (FIG. 5) of the opening <u>164</u>. The cocking pin <u>162</u> is thus reseated in the notch <u>168</u> its position prior to loading the round into the chamber. The sear spring <u>206</u> returns the sear <u>169</u> to the position illustrated in FIG. 12.

As the bolt is pulled rearwardly to eject the cartridge case, the ejector 98 is received in the slot 96 (FIG. 6) of the bolt and the ejector strikes the lower edge of the cartridge case which is then ejected from the receiver. Another round may then be loaded into the chamber and the firing cycle repeated.

It will be noted from the disclosure as seen in the drawings that the rifle is for a right handed shooter. Very few parts of the assembly would require changes in order to convert the same for left handed shooting. The bolt body, handle, and head, the extractor, the receiver port, the rear baffle, and the stock are the only parts requiring conversion to manufacture guns for the left <u>hand</u> shooter. The remaining mechanism need not be <u>altered</u> and accordingly most of the component parts can be interchangeably used for right hand or left hand rifles. 3,138,888

11

Having thus described the invention what is novel and desired to be secured by Letters Patent of the United States is:

1. In a rifle/or the like, a receiver having a lengthwise borc, a bolt slidable therein, a sear for holding the firing mechanism of said bolt in cocked position in the normal position of said sear, said receiver having opposed recesses formed in its lower portion generally beneath the real end thereof, said recesses including opposed vertical faces, said receiver further comprising a rearwardly extending tang having a slot adjacent its rear end, a U-shaped sheet metal trigger mounting bracket having its bridge generally vertically disposed and aligned with the rear end of said tang slot and with its arms extending forwardly thereof, the bridge of said bracket having a tab extending upwardly through said tang slot and rearwardly to engage an upper surface of said tang, said bracket further having ears extending upwardly from the forward ends of its arms and embracing the vertical faces of said receiver recesses; a retaining pin extending 20 through said bracket ears and said receiver as the single fastening element for mounting said bracket on said receiver, a trigger being pivotally mounted on a pin extending between the arms of said mounting bracket beneath and to the rear of said retaining pin, said sear be- 25 ing mounted on said retaining pin said trigger having a first leg for engaging said sear and releasably holding said sear in its normal position, said trigger further having a second leg extending rearwardly of its pivotal pin and being generally horizontally disposed, a safety mem-ber slidably mounted between the arms of said bracket and means for guiding said safety for longitudinal movement between a safe position in which the safety member is in obstructive relation with said second trigger leg pre-venting disengagement of said first leg from said sear and a firing position wherein the trigger may be moved to disengage said first leg from said sear and the rifle fired, the means for guiding said safety member comprising a thumb piece slidably engaging the upper surface of said tang and joined to said safety member by an integral upright portion extending through said tang slot, a pin extending between the arms of said mounting bracket and engaging a horizontal undersurface of said safety member and a bearing projection extending upwardly from said safety member and engaging the undersurface of said tang intermediate said thumb piec and said bearing member.

2. In a rifle or the like as in claim 1 wherein a raised land is formed on the rear end of said second trigger leg and a safety screw is threaded into the undersurface 50 of said safety member and is disposed above said raised land and in obstructive relation to releasing movement of said trigger in the safe position of said safety member, said safe position being the rearward position of said safety member and said safety member being slideable forwardly to dispose said safety screw in advance of said raised land in the firing position of said safety member.

3. In a rifle or the like as in claim 2 wherein the tang has a second slot spaced forwardly of the first-mentioned 60 tang slot, the bolt has a hub having a notch in its lower surface opening forwardly of said hub and disposed above said second tang slot and wherein the safety member has an upwardly extending projection passing through said second tang slot and entering said notch in the safe position of said safety member to prevent rotative movement of said bolt.

4. In a rifle or the like as in claim 3 wherein longitudinally spaced front and rear notches are formed in the upper surface of said second trigger lcg with the rear notch being disposed immediately in advance of said raised land and a spring loaded plunger projects from the lower surface of said safety member and enters said rear notch in the safe position of said safety member and en-75

ters the front notch in the firing position of said safety member.

5. In a rifle or the like as in claim 4 wherein the spring loaded plunger is mounted in a vertical hole in said safety member and a compression spring is urged thereagainst by a screw threaded into the upper end of said hole and wherein said screw is accessible through said rear tang slot for adjustment to vary the pressure exerted by said spring on said plunger and thereby vary the force required for pulling the trigger.

6. In a rifle or the like, as in claim 4 wherein the relative spacing between the notches on the rear trigger leg, the raised land thereon, the safety screw, the safety member projection for entering the hub notch are such that in the rear safe position of the safety member the safety screw is in obstructive relation with said raised land and the upwardly extending safety member projection is engaged with the hub notch with the spring loaded plunger entering the rear notch on the trigger leg and when the plunger is disposed intermediate said front and rear notches, the safety screw is in obstructive relation with said raised land preventing releasing movement of said trigger and said upwardly extending safety projection is disposed in advance of said hub notch thereby permitting rotation of said hub and when the plunger enters said front notch the safety member is moved in advance of said raised land and out of obstructive relation therewith.

7. In a rifle or the like comprising a receiver having a lengthwise bore, a bolt slidable therein, said receiver having a tang extending rearwardly thereof with a slot formed adjacent its rear end, a U-shaped trigger mounting bracket having its bridge vertically disposed and aligned with the rear end of said tang slot with its arms extending forwardly thereof, the bridge of said bracket having a tab extending upwardly through said tang slot and rearwardly to engage an upper surface of said tang, said bracket being secured to said receiver by a single retaining pin extending through the forward ends of the bracket arms and a porion of said receiver, a trigger pivotally mounted on a pin extending between the arms of said mounted bracket, said trigger having a sear engaging portion and a horizontal rearwardly extending leg, a safety member slidably mounted between the arms of said bracket and guided for horizontal movement between a rearward safe position and a forward firing position, a spring loaded plunger slidably mounted in a vertical hole formed in said safety member, a compression spring bearing against said plunger and urging it downwardly into engagement with said trigger leg, said spring being confined at its upper end by a screw threaded into said vertical hole, front and rear notches formed in said trigger leg and spaced apart a distance approximating the movement of said safety member between said safe, and firing positions and in combination with the plunger serve as detent means for said safety member as well as providing the means for urging said trigger into latching engagement with said sear.

8. In a rifle or the like as in claim 7 wherein a screw is threaded into said safety member forwardly of said plunger and depending therefrom and obstructively engaging said second trigger leg upon a predetermined travel of the leg past that necessary to release the sear.

9. In a rifle or the like comprising a receiver having a lengthwise bore, a bolt slidable therein, said receiver having a tang extending rearwardly thereof with a slot formed adjacent its rear end, a U-shaped trigger mounting bracket having its bridge vertically disposed and aligned with the rear end of said tang slot with its arms extending forwardly thereof, the bridge of said bracket having a tab extending upwardly through said tang slot and rearwardly to engage an upper surface of said tang said bracket being secured to said receiver by a single retaining pin extending through the forward ends of the bracket arms and a portion of said receiver, a triggerpivotally mounted on a pin extending between the arms of said mounted bracket, said trigger having a sear engag-

ing portion and a horizontal rearwardly extending leg, a safety member slidably mounted between the arms of said bracket and guided for horizontal movement between a hearward safe position and a forward firing position, a spring loaded plunger slidably mounted in a vertical hole formed in said safety member, a compression spring bearing against said plunger and urging it downwardly into engagement with said trigger leg, said spring being confined at its upper end by a screw threaded into said vertical hole, front and rear notches formed in said trigger 10 leg and spaced apart a distance approximating the movement of said safety member between said safe and firing positions to serve as detent means for said safety member

and with said spring loaded plunger to provide the means for urging said trigger into latching engagement with said sear.

## Model 700-40XC-40XR Three-Position Safety

An economic evaluation has been completed on the proposal to re-design the present Two-Position Safety to a Three-Position Safety on the Models 700-40XC-40XR rifles. Presently, the bolt on these rifles can be unlocked and opened only when the safe is in the 'Fire' position. The Three-Position safe would enable the bolt to be opened in either the 'Fire' position or the new 'U' position. On the 'U' position the rifle could not fire.

The economics indicate an annual cost increase of \$4400 and an expenditure of \$25,600 for new tooling and fixturing. The full book unit cost indicates a cost increase of \$.056 for each rifle.

Invention Report No. IT-300 A Fire Control For Bolt Action Rifles Having a Trigger and Sear Block

Other safeties in use are the firing pin block used by U.S. Repeating Arms (Winchester) and Weatherby.

#### SUMMARY OF INVENTION

The trigger block plunger has an enlarged tip that is depressed by the safety into a recess in the trigger when in the on safe position. The plunger releases the trigger by seating in a conical recess in the safety lever in the fire position. The plunger is mounted thru the trigger and housing and is spring loaded to the unblocked position.

### INVENTION DISCLOSURE

Completely assembled this unit consists of the present trigger housing assembly modified to accept the plunger, the trigger altered to have a thru clearance-hole and blocking recess, a compression spring to actuate the plunger, a newly designed safety lever, and the trigger block plunger.

### PRIOR ART

To the writer's knowledge there are no fire controls that have a trigger block passing thru the trigger

This system was designed for Bolt Action Rifles to eliminate unnecessary trigger movement, and may be adapted to Remington's present line.

BOLT LOCK

CC: C. B. WORKMAN J. S. MARTIN

RD-69 REV. 6-58

# **REMINGTON ARMS COMPANY, INC.**

INTER-DEPARTMENTAL CORRESPONDENCE

Remington,

BRIDGEPORT, CONN.

#### NOV. 5, 1980

FRED MARTIN

#### SUBJECT: BOLT LOCK FOR BOLT-ACTION RIFLES

A patent search has been made on the bolt lock shown in your Assembly Drawing SK-D-3596, and the corresponding detail drawings. The following are the most closely related prior patents that were located. In my opinion, they should not prevent us from securing a patent on your design.

> 1,669,496 - Stahl 1,322,514 - Bader

Stahl has a locking bolt 14 rotatably mounted in a transverse bore and passing across a flat 15 milled in the firing pin. When the firing pin is cocked as in Fig. 4, the forward end of the firing pin flat engages a mating flat on the locking bolt to prevent it from rotating. A detent pin 19 on the locking bolt (see Figs. 1 and 2) then restrains the bolt handle from being raised. However, the detent pin can be manually released by pressing a spring-loaded finger piece 21 (Figs. 1, 2 and 7). On firing, the locking bolt 14 is released by the firing pin, and is rotated out of locking engagement with the bolt handle simply by applying an upward pressure of the bolt handle on the detent pin 19.

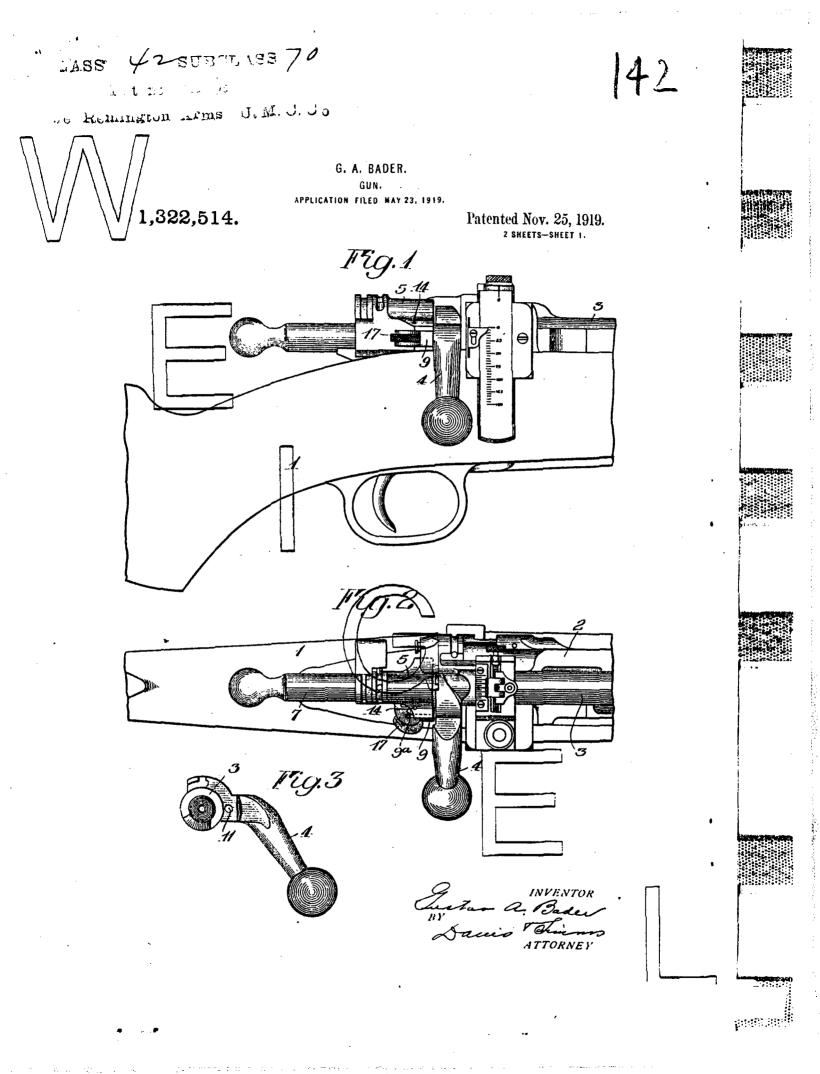

Bader slidably mounts a detent 9 on a bolt plug or sleeve 5 to engage (Fig. 4) or disengage (Fig. 5) the bolt handle. A J-shaped pivoting lever 13 is spring-biased in a direction to normally engage the detent with the bolt handle. The detent 9 may be withdrawn to unlock the bolt either by manual rotation of the lever 13 when the firing pin is cocked, or by engagement with a shoulder 24 on the firing pin when the rifle is fired.

WILLIAM L. ERICSON SENIOR PATENT COUNSEL

WLE/dt

48.50

# UNITED STATES PATENT OFFICE.

GUSTAV A. BADER, OF ROCHESTER, NEW YORK.

### GUN.

#### Specification of Letters Patent. Patented Nov. 25, 1919.

Application filed May 23, 1919. Serial No. 299,103.

To all whom it may concern:

514.

Be it known that I, GUSTAV A. BADER, a citizen of the United States, and resident of Rochester, in the county of Monroe and 5 State of New York, have invented certain new and useful Improvements in Guns, of

which the following is a specification. The present invention relates more par-

- ticularly to the type of guns in which a re-10 ciprocatory <u>bolt mechanism carries a spring</u> pressed firing pin and is provided with a portion which rotates to lock the bolt mechanism in firing position, an object of this in-
- vention being to lock the rotary part of the 15 bolt mechanism against movement while in firing position and preferably to control such locking means automatically through the firing of the gun.
- To this and other ends, the invention con-20 sists of certain parts and combinations of parts all of which will be hereinafter described, the novel features being pointed out in the appended claims. In the drawings:

- 25 Figure 1 is a fragmentary side view of a gun equipped with the present invention, Fig. 2 is a fragmentary top view of said gun:
- Fig. 3 is a rear view of the breech bolt; Fig. 4 is a horizontal sectional vidw 30 through a portion of the gun in the plane of the axis of the firing pin showing the locking device locking the breech bolt in closed position;
- Fig. 5 is a detail sectional view of the firing pin engaging the locking device and holding said locking device out of connection with the breech bolt;

Fig. 6 is a detail view of the sleeve which 40 connects with the rear end of the breech bolt;

Fig. 7 is a vertical transverse section through said sleeve showing the manner in which the locking device is mounted on the 45 sleeve; and

Fig. 8 is a detail view of one member of the locking device.

The invention herein is illustrated in the U.S. magazine rifle, model of 1903, which is

50 described in publication #1923 of the Ord-nance Department U. S. A., revised Febru-ary 14, 1908, entitled "Description and Rules for the Management of the U. S. Magazine the firing pin. T Rifle, Model of 1903, Caliber 30," and ref-known parts of 55 erence may be had to this publication for above mentioned.

any parts of the rifle which are not herein shown as it is unnecessary to illustrate in detail such a rifle in view of the fact that the invention is confined to an addition to the same. It will be understood however, that 60 the invention is not limited to a rifle such as shown in the above montioned publication but may be embodied in any construction where similar results are desired.

In rifles of the type mentioned, unless the 65 bolt handle is turned fully down, the cam on the cocking piece will strike the cocking cam on the bolt and the energy of the main spring will be expended in closing the bolt, instead of on the primer; this prevents the 70 possibility of a cartridge being fired until the bolt is fully closed, (see page 30 of the publication above referred to). In most instances, the bolt handle is turned fully down but is afterward unintentionally and un- 75 knowingly shifted slightly in an upward direction so that when the trigger is pulled the firing does not take place. It will be readily understood that this is not only a isauvantage to an army in battle but it is 80 roaming many hours, and may be days, meets game only to lose it through misfire due to the upward shifting of the bolt handle of which he had no knowledge. According to 85 this invention the turning of the rotary part of the balt mechanism is prevented by a locking device which automatically enters into locking position to lock the rotary portion of the bolt mechanism, this locking de- 90 vice being automatically shifted out of lock-

Referring to the onlocation of the in-vention herein shown, 1 indicates the stock of the gun and 2 the receiver on which the 95 bolt mechanism is reciprocable. This mechanism comprises in this instance a breech block 3 reciprocable and rotatable in the well of the receiver and interlocking with the receiver by a rotary movement under the 100 action of the handle 4, a sleeve 5 being guided on the receiver to be held against turning with the bolt and having a screw threaded connection 6 with the bolt. Carried by the sleeve and the breech bolt is a fir- 105 ing pin 7 which is acted upon by a main spring 8 of helical formation surrounding the firing pin. The foregoing parts are the known parts of the U.S. magazine rifle 110

causing the energy of the main spring of the fiving pin to be used up in closing the bolt idstead of acting on the primer with full force. According to the illustrated embodiment of this invention, means is provided r locking the breech bolt in its innermost 10 position interlocked with the receiver. This means in this instance comprises a detent 9 preferably slidably mounted on the sleeve 5 at one side of the latter by form-15 ing grouses: 2ª in the upper and lower sur-faces of the detent and projecting ribs 9<sup>b</sup> on the sleeve to fit into said grooves 92. This detent may have a nose 10 adapted to enter a recess or notch 11 formed in the rear face 20 of the bolt arm 4, the uppermost face of the nose 10 being beveled at 12 so that when the bolt the lis away to its lowermost po-sition. it will cooperate with the cam face 12.

As before pointed out, the handle 4 on

the breech bolt 3 is shifted accidentally at times/away from its lowered position where it jocks the breech bolt to the receiver, thus

- and move the latter rearwardly, after which 25 the detent 9 will move under the action of a spring to be described, so that the nose 10 enters into the notch 11 and locks the bolt arm 4 in its lowermost position so that the bolt is held interlocked with the receiver.
- 30 The detent 9 may be controlled either manually or automatically, the latter being accomplished preferably through the firing pin 7. To these ends, a lever 13 may be pivotally mounted at 14 in the sleeve 35 5 and extend through an opening 15 in the detent 9, the layer baying on opposite cides detent 9, the lever having on opposite sides curved faces 16 acting as curved bearings for engaging opposite walls of the opening 15. On the outer side of the detent, the
  40 lever 13 may have a curved arm 17 and be-tween this arm 17 and the detent, a helical
- spring 18 may be arranged, said spring being received within a pocket 19 in the detent 9 and a rocking projection 20 on the
- 45 inner face of the arm 17. It will be apparent that this spring 18 acts on the operating lever 13 to shift the latter in a direction to move the detent 9 toward the arm 4 of the breech bolt 3. The pivot pin 14 may 50 act as a stop for limiting the movement of the detent 9 and to this end the inner face of the detent is provided above and below the lever 13 with notches 21 in which the pivot pin 14 is received, the ends of these 55 notches serving to limit the movement of the detent 9 on the guides of the sleeve 5. It will thus be apparent that the pin 14 not only holds the lever 13 to the sleeve 5 but
- also retains the detent on the sleeve 5 and 60 therefore the removal of this pin 14 permits the removal of the two parts as well as the spring arranged between such parts.
- The control of the detent 9 through the firing pin is preferably effected by provid-65 ing an extension 22 on the lever 13 which

projects through an opening 23 in the sleeve into the path of the usual shoulder 24 on the firing pin. When the firing pin is in its innermost position in the sleeve 5, this shoulder 24 engages the extension 22 of 70 the lever 13 and moves the lever 13 in a direction to carry the detent out of interlocking connection with the arm 4 of the breech bolt, as will be seen more clearly by referring to Fig. 5 of the drawings, thus 75 permitting the breech bolt to be rotated to become unlocked from the receiver in order that the bolt, the sleeve and the firing pin may be moved rearwardly after the firing pin is cocked. The shoulder 24 moves away 80 from the extension 22 permitting the end 22 to shift rearwardly under the action of the spring 18 and in this way to project the detent 9 forwardly so that when the arm 4 of the breech bolt is moved downwardly, 85 it will cooperate with the beveled end 12 of the detent shifting the latter to the rear so that the nose 10 may enter into the notch 11, thus locking the arm 4 of the breech bolt in the lower position. <u>In this position</u> 90 of the detent it may be moved rearwardly manually by pressing on the extension 17 of the lever 13 or it may be moved rear-wardly automatically by shifting the firing pin to its innermost position in the sleeve 5, 95 when the shoulder 24 will engage the lever extension 22 and through the lever shift the detent 9 to the rear.

From the foregoing it will be seen that there has been provided a locking device 100 which locks the rotary part of the bolt mechanism in interlocking connection with the receiver, thus preventing the accidental shifting of the bolt mechanism to an inop-erative position. This locking device is con- 105 trollable either manually or automatically so as to release the bolt mechanism. The automatic control is preferably effected through the firing of the gun due preferably to the shifting of the firing pin in firing, 110 the firing pin engaging with a lever which shifts the detent out of locking position.

What I claim as my invention and desire to secure by Letters Patent is:

1. A firearm of the type in which the 115 breech mechanism has a sliding movement in the receiver and a portion which rotates to lock the mechanism in firing position, dis-tinguished by a locking device which locks the rotary part against rotary movement, 120 and is operated automatically to release the rotating part on the firing of the gun.

2. A firearm of the type having a reciprocatory bolt mechanism provided with a firing pin movable with said bolt mechanism 125 and also relatively thereto and also with a portion rotatable to lock the bolt mecha nism in firing position, distinguished by a locking device for locking the rotary portion against rotary movement, said locking 130

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

device being controlled by the firing pin to release/the rotary portion on the firing of the gun. 3./4 firearm of the type having a recipro-

catory bolt, a sleeve reciprocating with said the bolt, distinguished by a locking device which is carried by the sleeve, cooperates with the breech bolt to hold the latter 10 against rotation and is operated automati-cally on the firing of the gun to release the

breech bolt.

4. A firearm of the type having a rotary and reciprocatory breech bolt, a sleeve re-15 ciprocating with the bolt but held against rotation therewith, and a firing pin moving with the sleeve and the breech bolt and also relatively to said parts, distinguished by a

locking device for holding the breech bolt against rotation, said locking device being 20 mounted upon the sleeve and controlled by the firing pin.

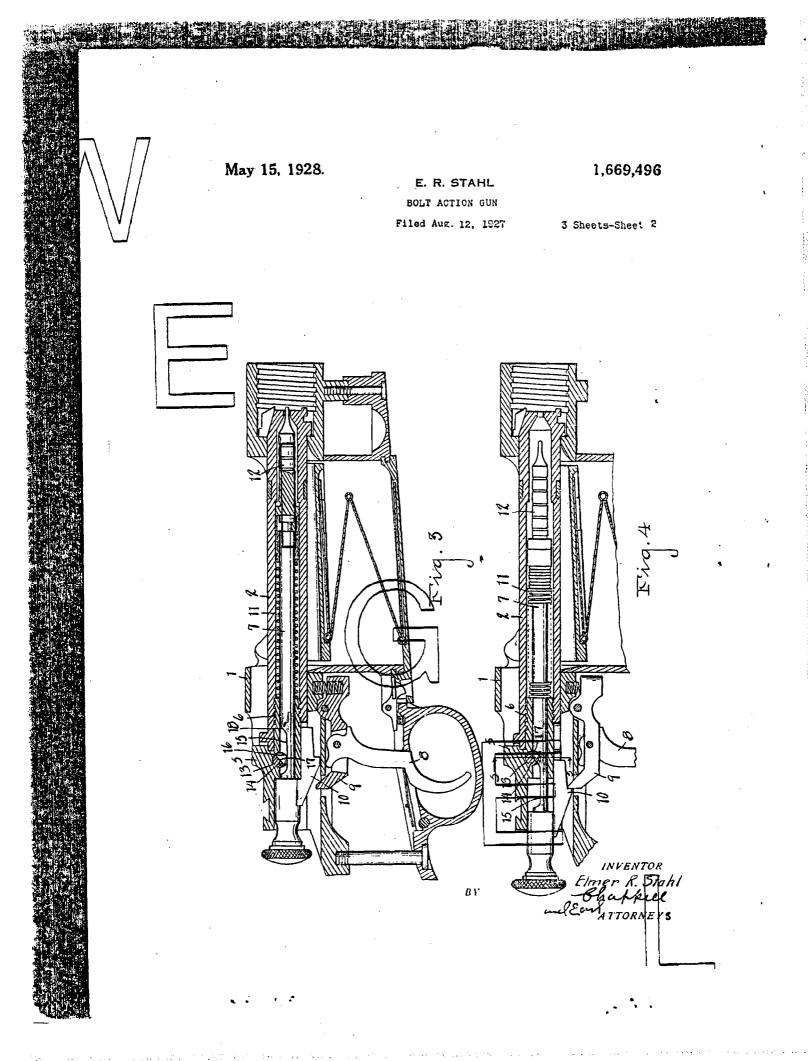

5. A firearm comprising a rotary and reciprocatory breech bolt, a sleeve reciprocating with the bolt but held against rotation 25 with said bolt, a firing pin reciprocating with the sleeve and the bolt and also movable relatively to said parts, a detent slidably mounted upon the sleeve and adapted to cooperate with the breech bolt to hold the 30 latter against turning, and a lever mounted on the sleeve and having a manually op-erable portion and also a portion arranged to be operated by the firing pin.

# UNITED STATES PATENT OFFICE.

ELMER R. STAHL, OF DOWAGIAC, MICHIGAN.

BOLT-ACTION GUN.

#### Application filed August 12, 1927. Serial No. 212,492.

The main objects of this invention are: bolt action guns in which the flight of the firing prij is away from and unimpeded by 5 the toeking means.

Second, to provide a breech bolt locking means which is automatic in its operation.

Third, to provide an automatic breech bolt locking means which is capable of manual 10 release.

Fourth, to provide a breech bolt locking means in which the parts are comparatively simple and are sp formed and supported that they are not likely to be injured or ren-

 16 dered inoperative in use by severe or carcless manipulation of the gun.
 Objects relating to details and economics of construction and operation of my invention will definitely appear from the detailed
 20 Instruction in the detailed 20 description to follow.

The invention is defined and pointed out in the claims.

A structure which is a preferred embodiment of my invention is illustrated in the 25 accompanying drawing, forming a part of

this application, in which: Fig. 1 is a side elevation of a gun action embodying the features of my invention, the stock and barrel and magazine being 80 omitted.

Fig. 2 is a fragmentary plan view.

Fig. 3 is a longitudinal section on a line corresponding to line 3-3 of Figs. 2. 5 and 7. certain parts being shown in full lines 35 for convenience in illustration, the firing pin being in firing position.

Fig. 4 is a fragmentary longitudinal section corresponding to Fig. 3 with the firing pin in retracted position.

40 Fig. 5 is a transverse section on line 5-5 of Figs. 1. 2. 4. and 7.

Fig. 6 is an enlarged detail partially in longitudinal section showing the firing pia in retracted or set position, with the breech

15 bolt locking bolt in locking relation thereto. Fig. 7 is a detail view partially in longi-tudinal section on line 7-7 of Figs. 1, 5 and 6.

Fig. 8 is a side elevation of the firing pin 50 with its plunger removed.

Fig. 9 is a side elevation of the non-rotating portion of the breech bolt.

Fig. 10 is a plan view of the locking bolt. Fig. 11-is a plan view of the locking bolt

55 detent and its spring.

In the drawing similar reference char-First, to provide a bolt locking means for acters refer to similar parts throughout the several views, and the sectional views are taken looking in the direction of the little arrows at the ends of the section lines.

Referring to the drawings, 1 represents the body or receiver portion of the breech bolt action. This is a standard commercial type and its structural details need not, therefore, be described.

The breech bolt 2 is mounted in the receiver for reciprocating and rotary movement as is common with gun actions of this type, the bolt being provided with a laterally projecting arm 3 having a hand piece 4 at 70 its outer end.

The breech bolt sleeve 5 is non-rotatably supported for reciprocating movement with the barrel portion of the breech bolt, having  $7\dot{8}$ threaded engagement therewith at 6.

The firing pin 7 is supported in the breech bolt and its sleeve for movement independ-ently thereof. The trigger 8 is hung from the sear 9 which engages the keeper 10 of the firing pin when the firing pin is retracted 80 or set, as shown in Fig. 4.

The firing pin is provided with an actuating spring 11 and a tappet or plunger 12.

The sleeve 5 is provided with a transverse bore 13 to receive and rotatably sup- 85 port the locking bolt 14. the firing pin having an elongated recess 15 to receive this bolt, the bore 13 in part intersecting the firing pin bore 15 in the sleeve 5.

The locking bolt has a segmental recess 16 99 which permits limited movement thereof and provides a flat face 17 coacting with the forwardly melined shoulder 18 at the forward end of the recess 15 when the parts are in locking position, the firing pin in this posi- 93 tion, as shown in Fig. 4, serving as a detent to support the locking bolt against rotation in releasing direction.

The locking bolt is provided with a detent 19 reciprocatingly mounted in a transverse 100 bore 20 in the locking holt, shown in Fig. 7, to coact with the arm 3 on the breech bolt. This detent is provided with a finger piece 21 which permits manual releasing of the detent should occasion require. 105

The locking bolt has a transverse kerflike recess 22 engaged by the retaining 23 for holding the parts in assembled position

With the parts thus arranged, when the 119

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

. . . .

1,660,406

## 2

breech bolt is actuated to set the trigger, the shoulder 18 of the firing pin is brought into engagement with the locking bolt, serving as a detent to support it against rotation,
the parts being then in position shown in Figs. 4, 6 and 7, the arm 3 being engaged by the detent 19 and thereby locked in its initial position so that the breech bolt cannot be accidentally removed in position to 10 impede the flight of the firing pin.

- Fit will be observed that while the firing pin constitutes an element of the locking means, its flight is away from the locking means so that its movement is not impeded by the locking means, its movement in fact
- being entirely free or independent from such locking means. I have intestrated and described my im-

provements in an embodiment which is high-20 ly practical. I have not attempted to illus-

19 practical. I have not attempted to illustrate or describe other embodiments or adaptations as I believe this disclosure will enable those skilled in the art to embody or adapt my improvements as may be desired.
 25 Eleving thus described my invention, what

25 Having thus described my invention, what I claim as new and desire to secure by Letters Patent, is:

 In a firearm, the combination of a receiver, a breech bolt <u>mounted</u> for reciprocating and rotary movement in said receiver and provided with a laterally projecting arm, a non-rotatable sleeve mounted to reciprocate with said bolt, a firing properatively associated with said breech bolt and

85 sleeve, a locking bolt rotatably mounted in said sleeve transversely of said firing pla, said firing pin having a transverse recess to receive said locking bolt, the front end of said recess being forwardly included pro40 yiding a locking shoulder, said locking bott

viding a locking shoulder, said locking bet having a transverse recess to receive said firing pin, the face of said recess being engaged by the said locking shoulder of the firing pin when the firing pin is in set position, and a

when the firing pin is in set position, and a 45 spring actuated reciprocating detent disposed transversely of said locking bolt to engage said breech holt arm when it is in its initial position, said detent being provided with a finger piece permitting the re-50 leasing of said breech bolt.

2. In a firearm, the combination of a receiver, a breech bolt mounted for reciprocating and rotary movement in said receiver and provided with a laterally projecting
 <sup>55</sup> arm, a non-rotatable sleeve mounted to reciprocate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, a locking bolt rotatably mounted in said sleeve transversely of said firing pin, so said firing pin having a transverse receive said locking bolt, said locking bolt having a transverse receive said firing pin, and a spring actuated reciprocating detent disposed transversely of said lock <sup>66</sup> ing bolt to engage said breech bolt arm when

it is in its initial position, said detent being provided with a finger piece permitting the releasing of said breech bolt.

3. In a firearm, the combination of a receiver, a breech bolt mounted for recipro 70 cating and rotary movement in said receiver, a non-rotatable sleeve mounted to reciprocate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, and means for locking said breech bolt comprising a locking bolt rotatably mounted in said sleeve transversely of said firing pin, said firing pin having a transverse recess to receive said locking bolt, the front end of said recess providing a locking shoulder, said so locking bolt having a transverse recess to receive said firing pin, the face of said recess being engaged by the locking bolt of the firing pin when the firing pin is in set position. 85

4. In a firearm, the combination of a receiver, a breech bolt mounted for reciprocating and rotacy movement in said receiver and provided with a laterally projecting arm, a non-rotatable sleeve mounted to re- 90 ciprocate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, and a locking bolt rotatably mounted in said sleeve transversely of said firing pin to be engaged by the firing pin when the 95 firing pin is in set position, said locking bolt having a spring actuated detent disposed to engage said breech bolt arm when it is in its initial position, said detent being 100 Inanually releasable.

5. In a firearm, the combination of a receiver, a breech holt mounted for reciprocuting and rotary movement in said receiver, a non-rotatable sleeve mounted to reciproeate with said holt, a firing pin operatively 105 associated with said breech holt and sleeve, and a locking member for said breech holt rotatably mounted in said sleeve transversely of said firing pin to be engaged by the firing pin when the firing pin is in set position. 110

6. A firearm comprising a rotary and reciprocatory breech bolt, a non-rotating sleeve reciprocating with the bolt, a firing pin reciprocating with the sleeve and bolt and movable relative to said parts, and means 115 for locking said bolt in firing position comprising a locking member mounted on said sleeve to cooperate with said bolt, said firing pin cooperating with said locking member to hold the same in bolt locking position 120 when the firing pin is in set position, the flight of the pin being away from said locking means whereby its movement is unimpeded by the locking means.

7. In a firearm, the combination of a re-125 ceiver, a breech bolt mounted for reciprocating and rotary movement in said receiver, a non-rotatable sleeve mounted to reciprocate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, 130

and a locking member for said breech bolt tively associated with said breech bolt, and mounted in said sleeve to be engaged by the firing pin when the firing pin is in set position.

8. A firearm comprising a rotary and reciprocatory breech bolt, a non-rotating sleeve reciprocating with the bolt, a firing pin operatively associated with said bolt and sleeve and movable relative thereto, and means for locking said breech bolt in firing position comprising a locking member nounted on said sleeve to cooperate with said breech bolt, said firing pin cooperating, when in-set position, with said locking member to hold the same in breech bolt locking position, the flight of the firing pin being away from said locking member whereby its movement is unimpeded by the locking means.

20 9. A firearm comprising a rotary and reciprocatory breech bolt, a non-rotating sleeve reciprocating with the bolt, a firing pin operatively associated with said bolt and <sup>25</sup> means for locking sail breech bolt in firing position comprising a locking member mounted on said sleeve to cooperate with said breech bolt, said firing pin cooperating, when in set position, with said locking mem-<sup>30</sup> ber to hold the same in breech bolt locking

position. 10. A firearm comprising a rotary and ciprocatory breech bolt, a firing pin opera-tively associated therewith, and a breech

<sup>35</sup> bolt locking means cooperating with said fir-ing pin when the firing pin is in set posi-tion to lock the breech bolt, the firing stroke of said firing pin being away from said lock ing means.

11. A firearm comprising a rotary and reciprocatory breech bolt, a firing pin operatively associated therewith, and a breech bolt locking means, said firing pin when in set position constituting a detent for the breech bolt locking means, the firing stroke of said firing pin being away from said locking means.

12. A firearm breech bolt action compris- my hand. ing a breech bolt mounted for reciprocatory and rotary movement, a firing pin opera-

a breech bolt locking means operatively associated with said breech bolt and firing pin, the firing pin acting when set to hold said locking means in locked position, the flight 55 of the firing pin being away from and unimpeded by said locking means.

13.' A firearm breech bolt action comprising a breech bolt mounted for reciprocatory and rotary movement, a firing pin opera- 60 tively associated with said breech bolt, and a breech bolt locking means operatively associated with said breech bolt and firing pin, the firing pin acting when set to hold said locking means in locked position.

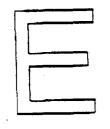

14. A breech bolt firearm action consisting of a breech bolt, automatic means for locking said breech bolt in initial position after actuation to set the firing pin, and a firing pin constituting a detent for said lock- 70 ing means, the flight of the firing pin being free and unimpeded by said locking means.

15. A breech bolt firearm action consisting of a breech bolt, automatic means for locking said breech bolt in initial position 75 after actuation to set the firing pin, and a firing pin constituting a detent for said locking means.

16. A firearm breech bolt action comprising a breech bolt mounted for reciprocatory 80 and rotary movement, a firing pin operatively associated with said breech bolt, and a breech bolt locking means operatively associated with said breech bolt and firing pin, the firing pin constituting a detent for 85 said locking means, the flight of the firing pin being free and unimpeded by said lockng means.

17. A firearm breech bolt action comprising a breech bolt mounted for reciprocatory 90 and rotary movement, a firing pin operatively associated with said breech bolt, and a breech bolt locking means operatively associated with said breech bolt and firing pin, the firing pin constituting a detent for said 95 locking means. In withess whereof I have hereunto set

### KEN JANTZ METALSMITHING

ROUTF 1 SULPHUR. OKLAHOMA 73086 (405) 622-3790

Dear Sir,

We are pleased to send you the enclosed brochure which will introduce you to our line of fine quality products.

We have manufactured and retailed our MAUSER SAFETIES for over ten years. During this time our market has grown to include every state in the U.S. + 9 foriegn countries. We have improved and perfected this product striving for quality and unsurpassed workmanship.

Jin Carmichael writes in "OUTDOOR LIFE" magazine - "Jantz's safeties are gracefully contoured and feature a checkered thumb pad, they are as good or better than any I've seen--" Nick Harvey writes in Austrailias "Sporting Shooter" magazine -"The Jantz sideswing safety adds a touch of class--"

We now have a sideswing safety for the SPRINGFIELD which utilizes the original sleeve, as we have done with the Mauser. These Standard model SPRINGFIELD safeties sell for \$59.95. Our Classic safety for the Springfield is completely machined (from the sleeve to the safety handle). This is a 3-position safety which adds classic lines to your fine custom rifle. These are now available for \$124.95.

The REM 700 side safety, which also fits the 721,722, 600, Mohawk, 40x and XP-100, is completely machined, designed to add elegance to the finest custom rifle. With this 3-position safety you can lock the bolt or open the action while on safe. We offer a right or left hand model, each with complete fitting instructions. The current price of these safeties  $\frac{16}{16}$  \$87.95.

Our RUGER sideswing safety, a must for every owner of a Ruger 77 action is a completely custom classic design 3-position safety. With complete fitting instructions, these sell for only \$87.95.

We also have a SAKO 3-position safety available on a custom order basis. We must have your complete action to complete this safety.

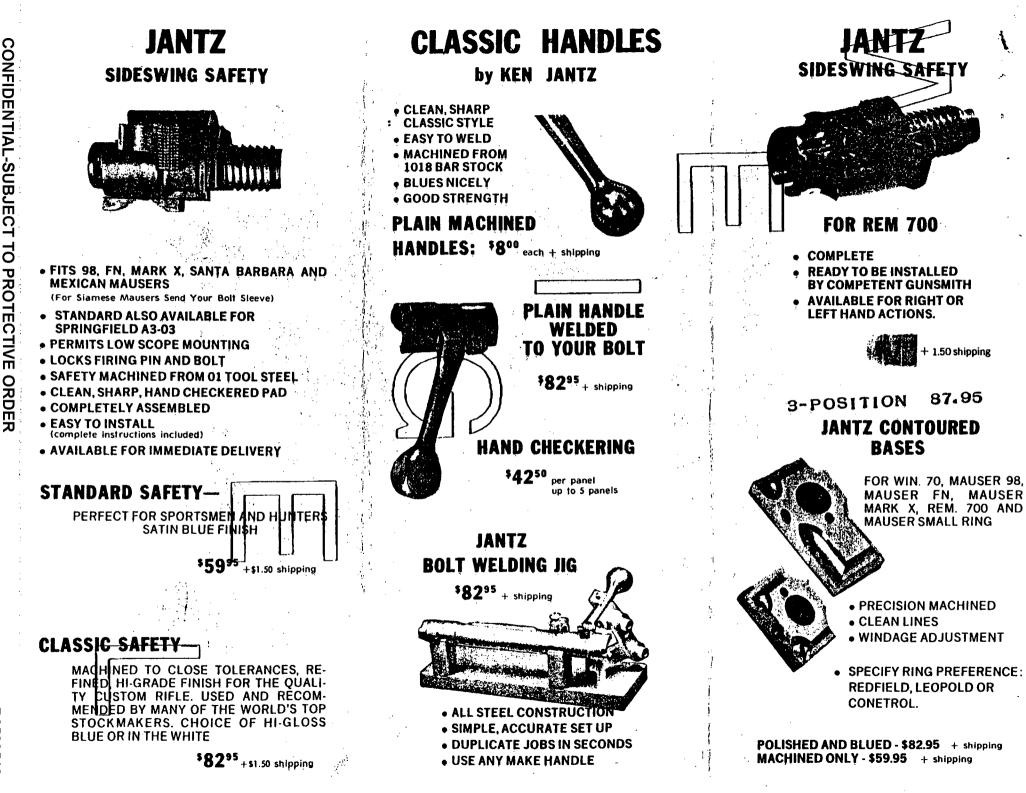

Thank you for your interest, we look forward to pleasing you with our quality products soon.

Sincerelu Ken Jantz

10149-EJ REMINGTON ARMS COMPANY. INC. xc: C. B. Workman INTER-DEPARTMENTAL CORRESPONDENCE I. S. Martin F. E. Martin <u>Remington</u> DETERS E. R. Owens **OUPOND** OTTOND VE YOUR LETTER TO ONE SUBJECT ONLY NFI April 8, 1981

To: T. L. Capeletti W. Bower 🖉 From M/700 Bolt Lock Re: Manufacturing Costs

In October, 1980, Industrial Engineering issued a report on the cost of the M/700 Bolt Lock based on a PE & C estimate. Because of the seemingly high cost to manufacture this feature, the Research Process Development Group was asked to review. Exhibit 1 shows a comparison of costs based on estimates prepared by PE & C, Research, and a hypothetical best case.

The major difference between the Research and PE & C estimate is the labor cost to make the extra cuts in the Bolt Plug. PE & C estimated two special machines, the Research estimate provides for 1 machine, and, therefore, less labor input. This \$.21 difference is multiplied when labor variance, industrial relations, and overhead are added to it.

The "best case" condition assumes that the pin hole in the Bolt Latch can be moved so that the powder metal blank can be made to include the hole. This \$.11 savings in the direct cost to drill the hole is again multiplied by the various overhead accounts.

Two other approaches are possible. If a high strength plastic could be substituted for powder metal in the Bolt Latch, it may be possible to reduce the total cost of the feature by an additional \$.20 below the "best case". Finally, the possibility of an investment cast It would be necessary to eliminate all of the added cuts in the investment cast blank, however, to show any significant savings.

JWB:ws Firearms Research Division Attach.

C. B. Workman J. P. Linde F. E. Martin S. A. Fanelli

REMINGTON ARMS COMPANY, INC.

<u>mington</u> ETERS **PUPONT** QUPOND YOUR LETTER TO ONE SUBJECT ONLY"\_

Ilion, New York January 9, 1981

A meeting was held on January 8, 1981 with John Linde and Process Personnel to resolve the problems on the M/700 bolt lock and the M/788 safety designs.

The bolt lock design was covered first and a complete review of each component was discussed as to the design/cost, etc. The plunger will be looked at again (.0234) and the bolt handle. New quotes will be made. The rest of the parts were inspected for design/cost, etc. and found to be in line. Other designs were shown including the latest and the cost savings <u>vs</u>. the appearance and acceptability was not that much greater.

It was agreed upon that we will stay with the design we now have. Five models are complete and ready for test.

It is my opinion that we should finalize the bolt lock design as is, finish the testing and if proven satisfactory with the new fire control design, make a proposal to the committee that this be approved.

If there are objections, the other proposal would be to just remove the bolt lock completely and go with our present M/700 design fire control.

### The M/788 Safety

The design was reviewed and explained to the Process Engineering Personnel.

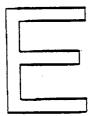

It was suggested that a large sample of springs and plungers be purchased and our present safety lever be altered to the new angle  $100^{\circ}$  included and

M/700 Bolt Lock - M/788 Safety

page 2 1-9-81

try the design of the new safety force (on and off) to better prove the design. The only other thing left would then be to add the new head design the way we have it.

If is the opinion of the writer that this is a good way to go and we have full cooperation from Process Engineering. We should propose the design this way to the committee, show the new design lever and ask for approval to proceed in this manner.

#### M/700 Bolt Latch Mechanism

Evaluation of the proposed Bolt Latch mechanism for M/700 rifles indicates it will result in a \$3.00 increase in unit factory cost (full allocation basis) in its first year (1982). For comparison purposes, a 1982 M/700 "Line Before" and three alternative "Line After" results were developed based on M/700 cost performance during the first six months of 1979. These alternatives were:

1. Adding of the Bolt Latch mechanism without adjusting prices.

- 2. Adding the Bolt Latch mechanism and adjusting prices to maintain the percent pretax margin.
- 3. Adding the Bolt Latch mechanism without adjusting prices, but deleting the sling and swivels from the BDL grade to compensate for the increased cost.

The results of these evaluations are summarized in the attached table which shows weighted average unit prices, costs, and pretax earnings and the project results. This data has been adjusted to anticipated 1982 price and cost levels.

As shown in this table, Alternative IZI is the most attractive in % margin, earnings, and net return on investment because it results in a net reduction in costs and working capital requirements. One disadvantage of this alternative is that ADL and Classic grade earnings are adversely affected, and the results shown depend on maintaining current product mix.

Alternative II also results in increased earnings, however, its net return on investment is substantially lower because of <u>additional</u> working capital requirements resulting from increased costs and <u>sales</u>.

All alternatives require project expenditures of \$249M construction and \$83M in operations charges. Detailed data for the line before and each alternative are attached.

### BOLT LATCH FOR BOLT-ACTION FIREARMS

This invention relates to firearms of the bolt-action type, which have a bolt reciprocable in a receiver between open and closed positions, and rotatable by means of a handle between locked and unlocked relationship to the firearm barrel. The invention is particularly concerned with an improved bolt latch mechanism which is normally operated automatically

- 10 by the firing and re-cocking of the firearm, but which may be selectively disabled, according to the user's wishes.
- In a bolt-action firearm intended for hunting use, it is desirable to provide both a safety, and a bolt latch for securing the bolt locked in a closed position. These two fleatures allow the firearm to be carried in the field loaded and cocked, without risk either of accidental firing, or of the bolt being unlocked by
- 20 some accidental jar or collision. At the same time, the user should be enabled to open the bolt readily and safely for unloading. Controls for the safety and bolt latch should be simple enough to avoid confusion in poor lighting conditions; should be readily
- 25 manipulable even by a hunter wearing gloves; and yet should not protrude in a manner either to interfere with manual operation of the firearm, or to be susceptible to inadvertent displacement.
- 30 One approach to this question is <u>shown in</u> U. S. Patent 2,514,981 to Walker et al, in which a two-position safety lever also serves as a bolt <u>latch</u>. The safety lever has two arms: a safety arm bearing an eccentric which blocks the sear of the trigger mechanism in a
- 35 "safe" position of the lever; and another latch arm which engages a notch in the bolt to latch it against rotation. Movement of the safety lever to the "fire" position releases the sear, and also removes

RA-0247

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

R2539547

the latch arm from engagement with the bolt. This is a satisfactory system; but it does require the safety to be released when the bolt is opened, and therefore calls for proper caution to be exercised when the user wishes to unload the firearm.

Another prior art solution involves a safety lever movable to three positions: one in which the safety and the bolt latch are both engaged; a second, inter-10 mediate position which either disengages the bolt latch, or enables it to be manually disengaged, but leaves the safety on; and a third, firing position in which both the safety and the bolt latch are

- excitement that often arises in the field, and under adverse conditions, error in selecting among three safety positions is not unlikely to occur.
- 25 Another solution that has been suggested is to provide a bolt latch that is completely diverced from the safety mechanism. This enables the hunter to unload without concern about changing the condition of a safety he has previously activated. Two examples of
- 30 such a bolt latch are found in U. S. Paterits 1,332,514 to Bader, and 1,669,496 to Stahl. In Bader, a sliding latch, mounted on the side of the bolt plug just behind the bolt handle, is movable to or from latching engagement with the bolt handle by means of a pivoted
- 35 lever, which is spring-biased toward the latch-engaging position. The latch may be withdrawn either by lever engagement with a shoulder on the firing pin when the

2

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON 良臣

rifle is fired, or by manual rotation of the pivoted lever. After manual opening with the rifle cocked, the pivoted lever must be held manually retracted in order to re-close the bolt.

In the Stahl Patent, a rotatable shaft, formed with a flat and carrying a spring-biased latch plunger, extends tranversely across a mating flat in the firing pin. The cocking of the firing pin mates the two flats so as to turn the shaft and latch plunger into

locking engagement with the bolt handle. Upon firing, the bolt handle may be raised, with the shaft and latch plunger now being free of the firing pin and able to rotate to permit this opening movement. After re-cocking, the latch may be retracted manually for unloading the rifle, although like Bader, it must also be helf retracted to permit the bolt to be re-closed.

R2539549

- 20 So far as applicant is aware, neither of the Bader nor Stahl latch mechanisms has ever been widely used or accepted. This may be at least in some part due to the awkwardness involved in holding the latches, which are in close proximity to the bolt handles,
- 25 open with the thumb of a left hand which supports the rifle, while the right hand concurrently opens or closes the bolt handle. This problem might be considerably exacerbated by the wearing of gloves.
- 30 The present invention has as its general object the improvement of bolt latch mechanisms for bolt-action rifles which have independently-operable safety devices. The improved mechanism features a simplified construction, involving a single pivoted, spring-
- 35 loaded lever to fulfill both the functions of an automatically-operated latching element, and a manual latch release. The device provides automatic detenting to releasably secure the latch in a disabled

RA-0247

10

position when it is manually released. The latch may be readily released or reactivated by the press of a gloved finger, after which the hands are freed to carry out loading, cocking, firing, or unloading operations without further attention to the latch.

According to a preferred embodiment of the invention, the bolt plug of a bolt-action firearm is recessed to receive a latch lever, which is pivotally mounted

- 10 in the recess for rocking motion to any of three positions: latched by cocking the weapon and closing the bolt handle; unlatched by firing the weapon; and manually disabled and detented in an unlatched condition. A spring and plunger bias the lever toward
- 15 the latched position, in which a tooth formed at one end of the lever engages in a mating notch in the closed bolt mandle. The latch lever has a cam surface so arranged, in the latched position, as to project into the path of motion of the head of the firing pin,
- 20 which therefore pivots the lever to the unlatched position when the weapon is fired. Subsequent re-cocking and withdrawal of the firing pin head enables the spring-loaded plunger to return the lever automatically to the latched position. The latch
- 25 lever may be manually rocked beyond the latched position to the disabled position, in which a detent notch formed in the lever engages and interferes with movement of the spring-loaded plunger; the plunger cannot then move the lever toward the latched position
- 30 until the lever is manually pressed in a direction to release the detent.

FIG. 1 is a fragmentary view in side elevation of a preferred embodiment of the improved bolt jatch

Ш

35 mechanism, shown in latched relation to the bolt assembly of an illustrative bolt-action firearm, which is shown cocked and ready to fire;

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

FIG. 2 is a fragmentary view in rear elevation of the assembly of FIG. 1;

FIG. 3 is a fragmentary view showing the latch in unlatched position, with the bolt handle raised to unlock the bolt, and the parts of the firearm in fired and uncocked condition;

FIG. 4 is a fragmentary cross-sectional view in side 10 elevation, with the parts in the same latched and

cocked condition as in FIG. 1;

FIG. 5 is a view similar to FIG. 4, but showing the firing pin in a fired position, and the latch mechanism 15 in an unlatched position; and

FIG. 6 is a view similar to FIGS. 4 and 5, but showing the firing pin in a cocked position, and the latch mechanism detented in a disabled position.

20

The improved bolt latch mechanism is broadly applicable to bolt-action firearms of various designs, but is shown for purposes of illustration in a bolt-

- action rifle of substantially the same type as is 25 shown in more detail in IIIS. Patents 2,585,195 to Walker and 2,514,981 to Walker et al, which were assigned to the owner of the present application. The rifle includes a hollow cylindrical bolt 10 which is mounted for rotation and longitudinal reciprocation
- 30 in a receiver (not shown), by means of a Handle 12 brazed or otherwise secured to the bolt. The bolt, when closed against the breech of the rifle barrel, may be locked by means of conventional lugs formed on its forward end (not shown), which are engaged by
- 35 rotating the handle down into the position shown in FIGS. 1 and 2, or unlocked by raising the handle to the position of FIG. 3. The bolt is shown in its

5

RA-0247

closed longitudinal position with respect to elements of a fire control mechanism which includes a sear 34 and a trigger 35. With the bolt turned to its unlocked position of FIG. 3, it may be pulled longitudinally to the left to open the action for loading and unloading cartridges, and for cocking a firing pin 24.

A bolt plug 16 has a threaded extension 18 which extends forwardly into threaded engagement with

10 internal threads 14 formed in the bolt, thus drivingly connecting the bolt and bolt plug for joint longitu-dinal reciprocation, but permitting the bolt to rotate independently. The bolt plug is formed with recessed flats 19 for sliding engagement with mating surfaces 15 formed on the receiver (not shown), to restrain the bolt plug from rotating with the bolt. The bolt plug also has a cylindrical recess 20 slidably receiving an enlarged head 26 of the firing pin 24, and a slot 22 through which a sear-engaging lug 28 and a cocking arm 30 of the firing pin extend in freely-slidable

but non-rotatable relation.

- In the relative positions of these elements shown in FIGS. 1 and 4, the firing pin 24 is cocked, with an oblique face 42 of the fug 28 bearing against a mating face 40 of the sear 4. The firing pin is continuously urged toward a firing position, that is, toward the right in the drawings, by a conventional firing pin spring contained within the bolt. The sear,
- 30 pivoted on a pin 36, is held in its illustrated angular position by the engagement between a step 39 in the sear and a connector 37 attached to the trigger 35, thereby restraining the firing vin in its cocked position. To fire the weapon, the trigger is pulled
- 35 to move the connector 37 to the position shown in FIG. 3. The angle of the faces 40 and 42 with respect to the longitudinal axis of the bolt and firing pin is

6

RA-0247

such that the firing pin spring exerts a downward component of force on the sear that overcomes the upward force exerted by a sear spring 33, and pivots the sear counterclockwise to the position shown in FIG. 3, permitting the firing pin to be driven forwardly to its fired position shown in FIG. 5.

In the fired condition, the cocking arm 30 of the firing pin extends forwardly into the deepest part of a cocking cam 32 cut into the bolt 10, which is cir-10 cumferentially aligned with the cocking arm when the bolt is closed (compare FIGS. 1 and 3). After firing, raising the bolt handle to the position of FIG. 3 causes the cocking arm to ride along the curved surface 15 of the cam 32, and retracts the firing pin back toward the cocked position. Then as the bolt is opened and re-closed by a reciprocating movement along its major axis, the lug face 42 engages against the re-elevated sear face 40 and retains the firing pin in the cocked condition of FIGS. 1 and 4 once more. 20

The firearm action thus far described is conventional in design, and is further illustrated and described in the aforementioned Patents 2,585,195 and 2,514,981.

- 25 Therefore, no further detailed description of its operation and design is believed necessary. A safety mechanism of any type suitable to such an action may be utilized as desired, and the bolt latch of the present invention is intended to operate entirely independently
- 30 of the safety mechanism. As illustrated, the sear 34 is provided with a cam lobe 38 for cooperation with a safety lever having an eccentric, of the kind disclosed in Patent 2,514,981, which is selectively operable to block the sear against movement from the cocked
- 35 position of FIG. 1. This is intended merely as an illustrative example of various safety mechanisms that might be used in conjunction with the improved bolt

7

EA-0247

7

latch, which will now be described.

recess 50, in which a latch lever 51 is pivotally supported on a pin 60 received in a tranverse hole 58. The lever 51 has a tooth 52 at its forward end, which, in a latched position of FIGS. 1 and 4, engages in a locking notch 62 at the rear of the bolt 10 and handle 12 to prevent the bolt from being moved from 10 its closed and locked position. A plunger 68 is slidably received in a blind hole 64 in the bolt plug, and is urged against a rear face 53 of the lever 51 by a spring 66 to bias the lever in a clockwise direction toward the latched position.

The bolt plug 16 is formed with a radially-extending

The latch lever 51 is formed with a planar cam surface 55 which projects into the recess 20 in the latched position of FIG. 4, into the path of movement of the outer cylindrical surface of the firing pin head 26

- 20 from its cocked position of FIG. 4 to its fired position of FIG. 5. In the latched position, the cam surface 55 extends in a direction inclined downwardly in a forward direction with respect to the longitudinal axis A of the firing pin motion. When the trigger 35
- 25 is pulled to release the firing pin, the forwardlymoving cylindrical bad 26 engages the cam surface 55 and pivots the lever 51 to the unlatched position shown in FIG. 5, against the bias of the spring-loaded plunger 68. The bolt 10 is now free to turn, and may 30 be unlocked and opened. The surface 55 continues to
- be inclined downwardly in a forward <u>direction</u>, for a reason which will appear, but at a greatly reduced angle to the bolt axis A.
- 35 Re-cocking of the firing pin 24 frees the cam surface 55 from the head 26. This allows the plunger 68 to automatically re-latch the lever 51 in the position

8

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

of FIG. 4, as the bolt handle is closed and the locking notch 62 becomes aligned with the tooth 52.

The rear face 53 of the latch lever is formed with a detent notch 70, which is not reached by the plunger 68 sliding along the face 53 during the pivotal movements of the lever between the latched position of FIG. 4 and the unlatched position of FIG. 5. However, the lever may be rocked, by applying finger 10 pressure to a projecting V-shaped upper surface 54, counterclockwise into a further disabled position shown in FIG. 6, in which the plunger 68 seats in the The engagement between the plunger and the notch 70. notch-restrains the lever against being rotated by the bias of the spring 66, and thus detents the lever 15 in this disabled position.

To provide for an ample arcuate displacement between the unlatched and disabled positions of the lever 51, the surface 55 must have some clearance from the head 20 26. Thus this surface is inclined downwardly at a small angle to the axis A in both the unlatched and the disabled positions, but in opposite axial directions.

25

When placed in the disabled, detented position of FIG. 6, the latch lever 51 will remain inoperative and unaffected by movement of the firing pin, until such time as finger pressure is applied to it in a 30 clockwise direction to release the plunger 68 from the notch 70, and thus restore the parts to the normal automatically-operating positions of FIGS. 4 and 5.

0

RA-0247

In a hunting situation in the field, where a series of shots may be fired, the bolt is cyclically opened to reload the rifle, and reclosed to cock the firing pin for the next shot; and the latch lever automatically cycles between the latched and unlatched positions of FIGS. 4 and 5. Assuming, however, that the hunter wishes to unload the cocked and latched rifle without firing previously-loaded live rounds, he need not release the safety to do so. He merely presses the latch lever 51 into the disabled position of FIG. 6. 10 and opens the bolt with the safety engaged. When he next wishes to reload the rifle, the latch lever should be pressed to release it from the detented disabled condition, so that its normal automatic operation is restored. 15

10

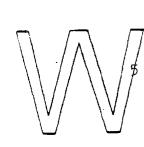

The latch lever is preferably positioned near the top of the bolt plug as shown, so that it is readily visible and easily pressed even with a gloved hand, 20 but does not protrude in such a location as to be

readily subject to accidental operation by the user's hand carrying the rifte or by jarring against other objects.

10

RA-0247

CLAIM 1. In a bolt-action firearm of the type having a bolt rotatably mounted for movement between open and closed positions; a bolt plug non-rotatably mounted and having threaded connection with said bolt; a firing pin mounted reciprocably in said bolt plug for movement between fired and cocked positions with respect to said bolt; the improved latch mechanism which comprises:

- 10 A latch lever having a tooth; said bolt being formed with a notch arranged for receiving said tooth when said bolt is rotated to its closed position; said latch lever being pivotally mounted on said bolt plug for pivotal movement between a latched position in which 15 said tooth is engaged in said notch to lock said bolt against rotation, and an unlatched position in which said tooth is disengaged from said notch to release said bolt; means for biasing said latch lever toward said latched position; said latch lever having cam
- 20 means constructed and arranged to cooperate with said firing pin to pivot said latch lever from said latched to said unlatched position thereof in response to movement of said firing pin from said cocked to said fired position thereof; releasable detent means for 25 said latch lever; said latch lever being further
- pivotally movable to a detented disabled position in which said detent means is operable to releasably secure said latch lever against movement by said biasing means.

30

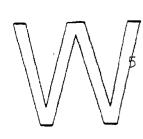

35

CLAIM 2. A bolt latch mechanism as recited in CLAIM 1, said latch lever being selectively manually pivotable between said detented disabled position and said latched and unlatched positions by applying pressure in alternate angular directions to said latch lever.

11

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

CLAIM 3. In a bolt-action firearm of the type having a .bolt rotatably mounted for movement between open and closed positions; a bolt plug non-rotatably mounted and having threaded connection with said bolt; a firing pin mounted reciprocably in said bolt plug for movement between fired and cocked positions with respect to said bolt; the improved bolt latch mechanism which comprises:

- 10 a latch lever having a tooth; said bolt plug being formed with a recess receiving said latch lever; said bolt being formed with a notch arranged for receiving said tooth when said bolt is rotated to said closed position; means mounting said latch lever in said 15 recess for pivotal movement between a latched position in which said tooth is engaged in said notch to latch said bolt against rotation with respect to said bolt plug, and an unlatched position in which said tooth is disengaged from said notch to release said bolt; 20 spring-biased plunger means mounted in said bolt plug for biasing said latch lever toward said latched position;
- said latch lever having cam means arranged to project 25 when said latch lever is in said latched position thereof, into the path of reciprocation of said firing pin, whereby movement of said firing pin to said fired position normally pivots said latch lever to said unlatched position, and movement of said firing pin to
- 30 said cocked position normally permits said springbiased plunger means to pivot said latch-lever to said latched position;

said latch lever having a detent notch, and being 35 manually pivotable in said recess to a disabled position in which said tooth is released from said locking notch and said detent notch engages said

CLAIM 8. A bolt latch mechanism as recited in CLAIM 7, said latch lever being constructed and pivotally 7 mounted so that in said unlatched position thereof, said cam surface slidably engages said head surface and remains inclined to the axis of reciprocation of said firing pin in the direction of movement of said head from said cocked to said fired positions thereof, but at a smaller angle than in said latched position of said latch lever, thereby permitting further

- 10 **pivotal** movement of said latch lever in said first angular direction into said disabled position without producing binding interference between said cam surface and said head surface.
- 15 CLAIM 9. A bolt latch mechanism as recited in CLAIM 3, said latch lever projecting from said bolt plug recess outwardly of said bolt plug, and having a Vshaped upper surface for manual rocking between said disabled position and said latched and unlatched
- 20 positions.

RA-0247

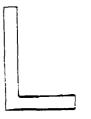

## ABSTRACT OF THE DISCLOSURE

15

A bolt-action firearm, of the type having a bolt rotatably movable between closed and open positions, has an improved bolt latch mechanism which is operable independently of a safety mechanism. The latch normally locks the bolt in closed position automatically when the firing pin is cocked and releases the bolt upon firing; but it may be 10 manually moved to a disabled position, in which it is detented. The latch mechanism is recessed in the bolt nlug in such fashion that it is readily visible and accessible, yet does not interfere with normal manual operation of the firearm, and does not protrude 15 so that it might be accidentally displaced.

#### ABSTRACT

A bolt-action firearm, of the type having a bolt rotatably movable between closed and open positions, has an improved bolt latch mechanism which is operable independently of a safety mechanism. The latch locks the bolt in closed position automatically when the firing pin is cocked, and releases the bolt upon firing. The latch mechanism is recessed in the bolt plug in such fashion that it is readily visible and accessible, yet does not interfere with normal manual operation of the firearm, and does not protrude so that it might readily be displaced accidentally. In one embodiment, the latch may be manually displaced to or from a disabled position, in which it is releasably detented.

### BOLT LATCH FOR BOLT-ACTION FIREARM

1

This application is a continuation of application Ser. No. 290,693 filed Aug. 6, 1981.

This invention relates to firearms of the bolt-action type, which have a bolt reciprocable in a receiver between open and closed portions. and rotatable by means of a handle between locked and unlocked relationship to the firearm barrel. The invention is particularly concerned with an improved bolt latch mechanism which is normally operated automatically by the firing and recocking of the firearm, but which may be selectively disabled, according to the user's wishes.

In a bolt-action firearm intended for hunting use, it is 15 desirable to provide both a safety, and a bolt latch for securing the bolt locked in a closed position. These two features allow the firearm to be carried in the field loaded and cocked, without risk either of accidental firing, or of the bolt being unlocked by some accidental 20 jar or collision. At the same time, the user should be enabled to open the bolt readily and safely for unloading. Controls for the safety and bolt latch should be simple enough to avoid confusion in poor lighting conditions; should be readily manipulable even by a hunter 25 wearing gloves; and yet should not protrude in a manner either to interfere with manual operation of the firearm, or to be susceptible to inadvertent displacement.

One approach to this question is shown in U.S. Pat. 30 In one embodiment, a detent is provided so that the latch No. 2,514,981 to Walker et al, in which a two-position safety lever also serves as a bolt latch. The safety lever has two arms: a safety arm bearing an eccentric which blocks the sear of the trigger mechanism in a "safe" position of the lever; and another latch arm which en-gages a notch in the bolt to latch it against rotation. Movement of the safety lever to the "fire" position releases the sear, and also removes the latch arm from engagement with the bolt. This is a satisfactory system; but it does require the safety to be released when the user wishes to unload the firearm.

Another prior art solution involves a safety lever movable to three positions: one in which the safety and 45 the bolt latch are both engaged; a second, intermediate position which either disengages the bolt latch, or enables it to be manually disengaged, but leaves the safety on; and a third, firing position in which both the safety and the bolt latch are inoperative. Examples of this 50 approach appear in U.S. Pat. Nos. 2,824,402 to Fischer; 1,318,423 to Williams; 2,869,269 to Couture; and 3,138,888 to Brewer. If a hunter is working in good lighting conditions, without gloves, and with leisure to see that the safety is correctly positioned, these systems 55 are satisfactory. But in the press of urgency and excitement that often arises in the field, and under adverse conditions, error in selecting among three safety positions is not unlikely to occur.

Another solution that has been suggested is to pro- 60 vide a bolt latch that is completely divorced from the safety mechanism. This enables the hunter to unload without concern about changing the condition of a safety he has previously activated. Two examples of such a bolt latch are found in U.S. Pat. Nos. 1,322,514 to 65 Bader, and 1,669,496 to Stahl. In Bader, a sliding latch, mounted on the side of the bolt plug just behind the bolt handle, is movable to or from latching engagement with

the bolt handle by means of a pivoted lever, which is spring-biased toward the latch-engaging position. The latch may be withdrawn either by lever engagement with a shoulder on the firing pin when the rifle is fired, or by manual rotation of the pivoted lever. After manual opening with the rifle cocked, the pivoted lever must be held manually retracted in order to re-close the bolt.

In the Stahl Patent, a rotatable shaft, formed with a 10 flat and carrying a spring-biased latch plunger, extends tranversely across a mating flat in the firing pin. The cocking of the firing pin mates the two flats so as to turn the shaft and latch plunger into locking engagement with the bolt handle. Upon firing, the flats disengage so 15 that the bolt handle may be raised, with the shaft and latch plunger now being free of the firing pin and able to rotate to permit this opening movement. If it is desired to unload the rifle with the firing pin cocked, the latch plunger may be retracted manually to permit the 20 bolt to be opened. The latch plunger must once again be held retracted to permit the bolt to be re-closed; this disadvantage is shared by Bader and Stahl.

g. Controls for the safety and bolt latch should be nple enough to avoid confusion in poor lighting contions; should be readily manipulable even by a hunter earing gloves; and yet should not protrude in a manre either to interfere with manual operation of the rearm, or to be susceptible to inadvertent displaceent. One approach to this question is shown in U.S. Pat. One approach to this question is shown in U.S. Pat. O. 2,514,981 to Walker et al, in which a two-position fety lever also serves as a bolt latch. The safety lever is two arms: a safety arm bearing an eccentric which is two arms: a safety arm bearing an eccentric which sition of the lever; and another latch arm which eniges a notch in the bolt to latch it against rotation.

According to the invention, the bolt plug of a boltaction firearm is recessed to receive a latch lever, which is pivotally mounted in the recess for rocking motion to either of two positions: latched by cocking the weapon and closing the bolt handle; or unlatched by firing the weapon. A spring and plunger bias the lever toward the latched position, in which a tooth formed at one end of the lever engages in a mating notch in the closed bolt handle. The latch lever has a cam surface so arranged, in the latched position, as to project into the path of motion of the head of the firing pin, which therefore pivots the lever to the unlatched position when the weapon is fired. Subsequent re-cocking and withdrawal of the firing pin head enables the spring-loaded plunger to return the lever automatically to the latched position.

In one embodiment, the latch lever may be manually rocked beyond the latched position to a disabled position, in which a detent notch formed in the lever engages and interferes with movement of the springloaded plunger. The plunger cannot then move the lever toward the latched position until the lever is manually pressed in a direction to release the detent and thus restore automatic operation.

FIG. 1 is a fragmentary view in side elevation of one embodiment of the improved bolt latch mechanism, shown in latched relation to the bolt assembly of an illustrative bolt-action firearm, which is shown cocked and ready to fire:

FIG. 2 is a fragmentary view in rear elevation of the assembly of FIG. 1;

FIG. 3 is a fragmentary view showing the latch in unlatched position, with the bolt handle raised to un-

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

3 lock the bolt, and the parts of the firearm in fired and

uncocked condition; FIG. 4 is a fragmentary cross-sectional view in side elevation, with the parts in the same latched and cocked condition as in FIG. 1;

FIG. 5 is a view similar to FIG. 4, but showing the firing pin in a fired position, and the latch mechanism is an unlatched position; and

FIG. 6 is a view similar to FIGS. 4 and 5, but showing the firing pin in a cocked position, and the latch 10 mechanism detented in a disabled position.

The improved bolt latch mechanism is broadly applicable to bolt-action firearms of various designs, but is shown for purposes of illustration in a bolt-action rifle of substantially the same type as is shown in more detail 15 in U.S. Pat. Nos. 2,585,195 to Walker and 2,514,981 to Walker et al, which were assigned to the owner of the present application. The rifle includes a hollow cylindrical bolt 19 which is mounted for rotation and longitudinal reciprocation in a receiver (not shown), by 20 means of a handle 12 brazed or otherwise secured to the bolt. The bolt, when closed against the breech of the rifle barrel, may be locked by means of conventional lugs formed on its forward end (not shown), which are engaged by rotating the handle down into the position 25 shown in FIGS. 1 and 2, or unlocked by raising the handle to the position of FIG. 3. The bolt is shown in its closed longitudinal position wih respect to elements of a fire control mechanism which includes a sear 34 and a trigger 35. With the bolt turned to its unlocked position 30 recess 50, in which a latch lever 51 is pivotally sup-of FIG. 3, it may be pulled longitudinally to the left to ported on a pin 60 received in a tranverse hole 58. The open the action for loading and unloading cartridges, and for cocking a firing pin 24.

A bolt plug 16 has a threaded extension 18 which extends forwardly into threaded engagement with inter- 35 nal threads 14 formed in the bolt, thus drivingly connecting the bolt and bolt plug for joint longitudinal reciprocation, but permitting the bolt to rotate independently. The bolt plug is formed with recessed flats 19 for sliding engagement with mating surfaces formed on 40 the receiver (not shown), to restrain the bolt-plug from rotating with the bolt. The bolt plug also has a cylindrical recess 20 slidably receiving an enlarged head 20 of the firing pin 24, and a slot 22 through which a searengaging lug 28 and a cocking arm 30 of the firing pin 45 extend in freely-slidable but non-rotatable relation

In the relative positions of these elements shown in FIGS. 1 and 4, the firing pin 24 is cocked, with an oblique face 42 of the lug 28 bearing against a mating face 40 of the sear 34. The firing pin is continuously urged toward a firing position, that is, toward the right in the drawings, by a conventional firing pin spring contained within the bolt. The sear, pivoted on a pin 36, is held in its illustrated angular position by the engagement between a step 39 in the sear and a connector 37 55 attached to the trigger 35, thereby restraining the firing pin in its cocked position. To fire the weapon, the trigger is pulled to move the connector 37 to the position shown in FIG. 3. The angle of the faces 40 and 42 with respect to the longitudinal axis of the bolt and firing pin 60 is such that the firing pin spring exerts a downward component of force on the sear that overcomes the upward force exerted by a sear spring 33, and pivots the sear counterclockwise to the position shown in FIG. 3, permitting the firing pin to be driven forwardly to its 65 fired position shown in FIG. 5.

In the fired condition, the cocking arm 30 of the firing pin extends forwardly into the deepest part of a cocking

cam 32 cut into the bolt 10, which is circumferentially aligned with the cocking arm when the bolt is closed (compare FIGS. 1 and 3). After firing, raising the bolt handle to the position of FIG. 3 causes the cocking arm to ride along the curved surface of the cam 32, and retracts the firing pin back toward the cocked position. Then as the bolt is opened and re-closed by a reciprocating movement along its major axis, the lug face 42 engages against the re-elevated sear face 40 and retains the firing pin in the cocked condition of FIGS. 1 and 4 once more.

The firearm action thus far described is conventional in design, and is further illustrated and described in the aforementioned U.S. Pat. Nos. 2,585,195 and 2,514,981. Therefore, no further detailed description of its operation and design is believed necessary. A safety mechanism of any type suitable to such an action may be utilized as desired, and the bolt latch of the present invention is intended to operate entirely independently of the safety mechanism. As illustrated, the sear 34 is provided

with a cam lobe 38 for cooperation with a safety lever having an eccentric, of the kind disclosed in U.S. Pat. No. 2,514,981, which is selectively operable to block the sear against movement from the cocked position of FIG. 1. This is intended merely as an illustrative example of various safety mechanisms that might by used in conjunction with the improved bolt latch, which will now be described.

The bolt plug 16 is formed with a radially-extending ported on a pin 60 received in a tranverse hole 58. The lever 51 has a tooth 52 at its forward end, which, in a latched position of FIGS. 1 and 4, engages in a locking notch 62 at the rear of the bolt 10 and handle 12 to prevent the bolt from being moved from its closed and locked position. A plunger 68 is slidably received in a blind hole 64 in the bolt plug, and is urged against a rear face 53 of the lever 51 by a spring 66 to bias the lever in a clockwise direction toward the latched position.

The latch lever 51 is formed with a planar cam surface 55 which projects into the recess 20 in the latched position of FIG. 4, into the path of movement of the outer cylindrical surface of the firing pin head 26 from its cocked position of FIG. 4 to its fired position of FIG. 5. In the latched position, the cam surface 55 extends in a direction inclined downwardly in a forward direction with respect to the longitudinal axis A of the firing pin motion. When the trigger 35 is pulled to release the firing pin, the forwardly-moving cylindrical head 26 engages the cam surface 55 and pivots the lever 51 to the unlatched position shown in FIG. 5, against the bias of the spring-loaded plunger 68. The bolt 10 is now free to turn, and may be unlocked and opened. The surface 55 continues to be inclined downwardly in a forward direction. for a reason which will appear, but at a greatly reduced angle to the bolt axis A.

Re-cocking of the firing pin 24 frees the cam surface 55 from the head 26. This allows the plunger 68 to automatically re-latch the lever 51 in the position of FIG. 4, as the bolt handle is closed and the locking notch 62 becomes aligned with the tooth 52.

In the illustrated embodiment, the rear face 53 of the latch lever is formed with a detent notch 70, which is not reached by the plunger 68 sliding along the face 53 during the pivotal movements of the lever between the latched position of FIG. 4 and the unlatched position of FIG. 5. However, the lever may be rocked, by applying finger pressure to a projecting V-shaped upper surface

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

To provide for an ample arcuate displacement between the unlatched and disabled positions of the lever 51, the surface 55 must have some clearance from the head 26. Thus this surface is inclined downwardly at a 10 small angle to the axis A in both the unlatched and the disabled positions, but in opposite axial directions.

When placed in the disabled, detented position of FIG. 6, the latch lever 51 will remain inoperative and unaffected by movement of the firing pin, until such 15 time as finger pressure is applied to it in a clockwise direction to release the plunger 68 from the notch 70, and thus restore the parts to the normal automatically-operating positions of FIGS. 4 and 5.

In a hunting situation in the field, where a series of 20 shots may be fired, the bolt is cyclically opened to reload the rifle, and reclosed to cock the firing pin for the next shot; and the latch lever automatically cycles between the latched and unlatched positions of FIGS. 4 and 5. Assuming, however, that the hunter wishes to 25 unload the cocked and latched rifle without firing previously-loaded live rounds, he need not release the safety to do so. He merely presses the latch lever 51 into the disabled position of FIG. 6, and opens the bolt with the safety engaged. When he next wishes to reload the 30 rifle, the latch lever should be pressed to release it from the detented disabled condition, so that its normal automatic operation is restored.

The latch lever 51 is preferably positioned near the top of the bolt plug as shown, so that it is readily visible 35 and easily pressed even with a gloved hand, but does not protrude in such a location as to be readily subject to accidental operation by the user's hand carrying the rifle, or by jarring against other objects.

I claim:

1. In a bolt-action firearm of the type having a substantially cylindrical bolt rotatably mounted for movement between open and closed positions; a bolt plug non-rotatably mounted and having threaded connection with said bolt; a firing pin mounted reciprocably in said 45 bolt plug for movement between fired and cocked positions with respect to said bolt; the improved bolt latch mechanism which comprises;

a latch lever having a tooth; said bolt plug being formed with a recess receiving said latch lever; said 50 bolt being formed with a locking notch opening onto an outer peripheral surface thereof at a location radially aligned with said tooth upon rotation of said bolt to said closed position; means mounting said latch lever in said recess for pivotal movement 55 about an axis substantially perpendicular to the longitudinal axis of said cylindrical bolt between a first, latched position in which said tooth is engaged in said locking notch to latch said bolt against rotation with respect to said bolt plug, and 60 a second, unlatched position in which said tooth is disengaged from said locking notch to release said bolt for rotation; spring-biased plunger means mounted in said bolt plug for biasing said latch lever toward said first position; 65

said latch lever having cam means arranged to project, upon pivotal movement of said latch lever into said first position, into the path of reciprocation of said firing pin, whereby movement of said firing pin to said fired position normally pivots said latch lever from said first to said second position to unlatch said bolt, and movement of said firing pin to said cocked position normally permits said spring-biased plunger means to pivot said latch lever from said second to said first position to latch said bolt;

said latch lever having a detent notch, and being manually pivotable in said recess to a third, disabled position in which said cam means is withdrawn from the path of reciprocation of said firing pin, said tooth is released from said locking notch and said detent notch engages said plunger means to interfere with rotation of said latch lever from said third position, and thereby render said plunger means inoperative to pivot said latch lever toward said first position thereof.

2. A bolt latch mechanism as recited in claim 1, said latch lever being manually pivotable from said disabled position toward said latched and unlatched positions thereof, by applying pressure sufficient to displace said plunger means from said detent notch.

3. A bolt latch mechanism as recited in claim 1, said latch lever having a face area normally bearing against said plunger means for relative sliding movement as said latch lever is pivoted between said latched and unlatched positions, said detent notch being formed in said face in a location spaced from said bearing area to engage said plunger means in said disabled position of said latch lever.

4. A bolt latch mechanism as recited in claim 1, said latch lever being pivotable: in a first angular direction into said unlatched position; in an opposite angular direction into said latched position; and beyond said unlatched position in said first angular direction into said disabled position.

5. A bolt latch mechanism as recited in claim 4, said 40 firing pin being formed with a head having a peripheral surface cylindrical about the axis of movement of said firing pin; said cam means comprising a cam surface formed on said latch lever; said latch lever being constructed and pivotally mounted so that in said latched 45 position thereof, said cam surface is inclined toward the axis of reciprocation of said firing pin in the direction of movement of said head from said cocked to said fired positions thereof, for sliding engagement by said head surface.

6. A bolt latch mechanism as recited in claim 5, said latch lever being constructed and pivotally mounted so that in said unlatched position thereof, said cam surface slidably engages said head surface and remains inclined to the axis of reciprocation of said firing pin in the direcition of movement of said head from said cocked to said fired positions thereof, but at a smaller angle than in said latched position of said latch lever, thereby permitting further pivotal movement of said latch lever in said first angular direction into said disabled position without producing binding interference between said cam surface and said head surface.

7. A bolt latch mechanism as recited in claim 1, said latch lever projecting from said bolt plug recess outwardly of said bolt plug, and having a V-shaped upper surface for manual rocking between said disabled position and said latched and unlatched positions.

#### BOLT LATCH FOR BOLT-ACTION FIREARMS

This invention relates to firearms of the bolt-action type, which have a bolt reciprocable in a receiver between open and closed positions, and rotatable by means of a handle between locked and unlocked relationship to the firearm barrel. The invention is particularly concerned with an improved bolt latch mechanism which is normally operated automatically

- 10 by the firing and re-cocking of the firearm, but which may be selectively disabled, according to the user's wishes.
- In a bolt-action firearm intended for hunting use, it is desirable to provide both a safety, and a bolt latch for securing the bolt locked in a closed position. These two features allow the firearm to be carried in the field loaded and cocked, without risk either of accidental firing, or of the bolt being unlocked by some accidental jar or collision. At the same time,
- the user should be enabled to open the bolt readily and safely for unloading. Controls for the safety and bolt latch should be simple enough to avoid confusion in poor lighting conditions; should be readily 25 manipulable even by a hunter wearing gloves; and yet
- should not protrude in a manner either to interfere with manual operation of the firearm, or to be susceptible to inadvertent displacement.
- 30 One approach to this question is shown in U. S. Patent 2,514,981 to Walker et al, in which a two-position safety lever also serves as a bolt latch. The safety lever has two arms: a safety arm bearing an eccentric which blocks the sear of the trigger mechanism in a
- 35 "safe" position of the lever; and another latch arm which engages a notch in the bolt to latch it against rotation. Movement of the safety lever to the "fire" position releases the sear, and also removes

RA-0247

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

the latch arm from engagement with the bolt. This is a satisfactory system; but it does require the safety to be released when the bolt is opened, and therefore calls for proper caution to be exercised when the user wishes to unload the firearm.

Another prior art solution involves a safety lever movable to three positions: one in which the safety and the bolt latch are both engaged; a second, interneediate position which either disengages the bolt latch, or enables it to be manually disengaged, but leaves the safety on; and a third, firing position in which both the safety and the bolt latch are inoperative. Examples of this approach appear in

- 15 U. S. Patents 2,824,402 to Fischer; 1,318,423 to Williams; 2,869,269 to Couture; and 3,138,888 to Brewer. If a hunter is working in good lighting conditions, without gloves, and with leisure to see that the safety is correctly positioned, these systems
- 20 are satisfactory. But in the press of urgency and excitement that often arises in the field, and under adverse conditions, error in selecting among three safety positions is not untakely to occur.
- 25 Another solution that has been suggested is to provide a bolt latch that is completely divorced from the safety mechanism. This enables the hunter to unload without concern about changing the condition of a safety he has previously activated. Two examples of
- 30 such a bolt latch are found in U. S. Patents 1,332,514 to Bader, and 1,669,496 to Stahl. In Bader, a sliding latch, mounted on the side of the bolt blug just behind the bolt handle, is movable to or from latching engagement with the bolt handle by means of a pivoted
- 35 lever, which is spring-biased toward the latch-engaging position. The latch may be withdrawn either by lever engagement with a shoulder on the firing pin when the

2

RA-0247

rifle is fired, or by manual rotation of the pivoted lever. After manual opening with the rifle cocked, the pivoted lever must be held manually retracted in order to re-close the bolt.

3

In the Stahl Patent, a rotatable shaft, formed with a flat and carrying a spring-biased latch plunger, extends tranversely across a mating flat in the firing pin. The cocking of the firing pin mates the two 10 flats so as to turn the shaft and latch plunger into locking engagement with the bolt handle. Upon firing, the flats disengage so that the bolt handle may be raised, with the shaft and latch plunger now being free of the firing pin and able to rotate to permit this opening movement.' If it is desired to unload 15 the rifle with the firing pin cocked, the latch plunger may be retracted manually to permit the bolt to be opened. The latch plunger must once again be held retracted to permit the bolt to be re-closed; this disadvantage is shared by Bader 20 and Stahl.

The present invention has as its general object the improvement of bolt latch mechanisms for bolt-action 25 rifles which have independently-operable safety devices. The improved mechanism features a simplified construction, involving a single pivoted, spring-loaded latch lever, which is automatically operated by the displacements of <u>a firing</u> pin during

- 30 cocking and firing. In one embodiment, a detent is provided so that the latch is selectively operable manually to releasably secure it in a disabled position. The latch may readily be disabled or reactivated by the press of even a gloved finger,
- 35 after which the hands are free to carry out loading cocking, firing, or unloading operations without further attention to the latch.

3

RA-0247

According to the invention, the bolt plug of a boltaction firearm is recessed to receive a latch lever. which is pivotally mounted in the recess for rocking motion to either of two positions: latched by cocking the weapon and closing the bolt handle; or unlatched by firing the weapon. A spring and plunger bias the lever toward the latched position, in which a tooth formed at one end of the lever engages in a mating notch in the closed bolt handle. The latch lever has a cam surface so arranged, in the latched 10 position, as to project into the path of motion of the head of the firing pin, which therefore pivots the lever to the unlatched position when the weapon is fired. Subsequent re-cocking and withdrawal of the firing pin head enables the spring-loaded plunger to return the lever automatically to the latched position.

4

In one embodiment, the latch lever may be manually rocked beyond the latched position to a disabled position, in which a detent notch formed in the lever engages and interferes with movement of the springloaded plunger. The plunger cannot then move the lever toward the latched position until the lever is manually pressed in a direction to release the detent and thus restore automatic operation.

FIG. 1 is a fragmentary view in side elevation of 30 one embodiment of the improved bolt latch mechanism, shown in latched relation to the bolt assembly of an illustrative bolt-action firearm, which is shown cocked and ready to fire;

4

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

FIG. 2 is a fragmentary view in rear elevation of the assembly of FIG. 1;

FIG. 3 is a fragmentary view showing the latch in unlatched position, with the bolt handle raised to unlock the bolt, and the parts of the firearm in fired and uncocked condition;

FIG. 4 is a fragmentary cross-sectional view in side 10 elevation, with the parts in the same latched and cocked condition as in FIG. 1;

FIG. 5 is a view similar to FIG. 4, but showing the firing pin in a fired position, and the latch mechanism 15 in an unlatched position; and

FIG. 6 is a view similar to FIGS. 4 and 5, but phowing the firing pin in a cocked position, and the laten mechanism detented in a disabled position.

20

The improved bolt latch mechanism is broadly applicable to bolt-action firearms of various designs, but is shown for purposes of illustration in a boltaction rifle of substantially the same type as is

- 25 shown in more detail in U.S. Patents 2,585,195 to Walker and 2,514,981 to Walker et al, which were assigned to the owner of the present application. The rifle includes a hollow cylindrical bolt 10 which is mounted for rotation and longitudinal reciprocation
- 30 in a receiver (not shown), by means of a handle 12 brazed or otherwise secured to the bolt. The holt, when closed against the breech of the rifle barrel, may be locked by means of conventional lugs formed on its forward end (not shown), which are engaged by
- 35 rotating the handle down into the position shown in FIGS. 1 and 2, or unlocked by raising the handle to the position of FIG. 3. The bolt is shown in its

5

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

closed longitudinal position with respect to elements of a fire control mechanism which includes a sear 34 and a trigger 35. With the bolt turned to its unlocked position of FIG. 3, it may be pulled longitudinally to the left to open the action for loading and unloading cartridges, and for cocking a firing pin 24.

A bolt plug 16 has a threaded extension 18 which extends forwardly into threaded engagement with 10 internal threads 14 formed in the bolt, thus drivingly connecting the bolt and bolt plug for joint longitudinal reciprocation, but permitting the bolt to rotate independently. The bolt plug is formed with recessed flate 19 for sliding engagement with mating surfaces 15 formed on the receiver (not shown), to restrain the bolt plug from rotating with the bolt. The bolt plug also has a cylindrical recess 20 slidably receiving an enlarged head 26 of the firing pin 24, and a slot 22 through which a sear-engaging lug 28 and a cocking

20 arm 30 of the firing pin extend in freely-slidable but non-rotatable relation.

In the relative positions of these elements shown in FIGS. 1 and 4, the firing pin 24 is cocked, with an 25 oblique face 42 of the Tug 28 bearing against a mating face 40 of the sear 34. The firing pin is continuously urged toward a firing position, that is, toward the right in the drawings, by a conventional firing pin spring contained within the <u>bolt</u>. The sear,

- 30 pivoted on a pin 36, is held in <u>the illustrated</u> angular position by the engagement between a step 39 in the sear and a connector 37 attached to the trigger 35, thereby restraining the firing pin in its cocked position. To fire the weapon, the trigger is pulled
- 35 to move the connector 37 to the position shown in FIG. 3. The angle of the faces 40 and 42 with respect to the longitudinal axis of the bolt and firing pin is

6

RA-0247

such that the firing pin spring exerts a downward component of force on the sear that overcomes the upward force exerted by a sear spring 33, and pivots the sear counterclockwise to the position shown in FIG. 3, permitting the firing pin to be driven forwardly to its fired position shown in FIG. 5.

In the fired condition, the cocking arm 30 of the firing pin extends forwardly into the deepest part of 10 a cocking cam 32 cut into the bolt 10, which is circumferentially aligned with the cocking arm when the bolt is closed (compare FIGS. 1 and 3). After firing, raising the bolt handle to the position of FIG. 3 causes the cocking arm to ride along the curved surface 15 of the cam 32, and retracts the firing pin back toward the cocked position. Then as the bolt is opened and re-closed by a reciprocating movement along its major axis, the lug face 42 engages against the re-elevated

20 condition of FIGS. 1 and 4 once more.

The firearm action thus far described is conventional in design, and is further illustrated and described in the aforementioned Patents 2,585,195 and 2,514,981.

sear face 40 and retains the firing pin in the cocked

- 25 Therefore, no further detailed description of its operation and design is believed necessary. A safety mechanism of any type suitable to such an action may be utilized as desired, and the bolt latch of the present invention is intended to operate entirely independently
- 30 of the safety mechanism. As illustrated, the sear 34 is provided with a cam lobe 38 for <u>coope</u>ration with a safety lever having an eccentric. of the kind disclosed in Patent 2,514,981, which is selectively operable to block the sear grainst movement from the cocked
- 35 position of FIG. 1. This is intended merely as an illustrative example of various safety mechanisms that might be used in conjunction with the improved bolt

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON latch, which will now be described.

The bolt plug 16 is formed with a radially-extending recess 50, in which a latch lever 51 is pivotally supported on a pin 60 received in a tranverse hole 58. The lever 51 has a tooth 52 at its forward end, which, in a latched position of FIGS. 1 and 4, engages in a locking notch 62 at the rear of the bolt 10 and handle 12 to prevent the bolt from being moved from 10 its closed and locked position. A plunger 68 is slidably received in a blind hole 64 in the bolt plug, and is urged against a rear face 53 of the lever 51 by a spring 66 to bias the lever in a clockwise direction toward the latched position.

8

The latch lever 51 is formed with a planar cam surface 55 which projects into the recess 20 in the latched position of FIG. 4, into the path of movement of the outer cylindrical surface of the firing pin head 26

- 20 from its could position of FIG. 4 to its fired position of FIG. 5. In the latched position, the cam surface 55 extends in a direction inclined downwardly in a forward direction with respect to the longitudinal axis A of the firing pin motion. When the trigger 35
- 25 is pulled to release the firing pin, the forwardlymoving cylindrical head-26 engages the cam surface 55 and pivots the lever 51 to the unlatched position shown in FIG. 5, against the bias of the spring-loaded plunger 68. The bolt 10 is now free to turn, and may
- 30 be unlocked and opened. The surface 55 continues to be inclined downwardly in a forward direction, for a reason which will appear, but at a greatly reduced angle to the bolt axis A.
- 35 Re-cocking of the firing pin 24 frees the cam surface 55 from the head 26. This allows the plunger 68 to automatically re-latch the lever 51 in the position

8

FA-0247

of FIG. 4, as the bolt handle is closed and the locking notch 62 becomes aligned with the tooth 52.

In the illustrated embodiment, the rear face 53 of the
latch lever is formed with a detent notch 70, which is not reached by the plunger 68 sliding along the face
53 during the pivotal movements of the lever between the latched position of FIG. 4 and the unlatched position of FIG. 5. However, the lever may be rocked,
by applying finger pressure to a projecting V-shaped upper surface 54, counterclockwise into a further
disabled position shown in FIG. 6, in which the plunger 68 seats in the notch 70. The engagement between the plunger and the notch restrains the lever

To provide for an ample arcuate displacement between the unlatched and disabled positions of the lever 51, 20 the surface 55 must have some clearance from the head 26. Thus this surface is inclined downwardly at a small angle to the aris A in both the unlatched and the disabled positions, but in opposite axial directions.

and thus detents the lever in this disabled position.

25

When placed in the isabled, detented position of FIG. 6, the latch lever 51 will remain inoperative and unaffected by movement of the firing pin, until such time as finger pressure is applied to it in a

30 clockwise direction to release the plunger 68 from the notch 70, and thus restore the parts to the normal automatically-operating positions of FIGS. 4 and 5.

9

RA-0247

In a hunting situation in the field, where a series of shots may be fired, the bolt is cyclically opened to reload the rifle, and reclosed to cock the firing pin for the next shot; and the latch lever automatically cycles between the latched and unlatched positions of FIGS. 4 and 5. Assuming, however, that the hunter wishes to unload the cocked and latched rifle without firing previously-loaded live rounds, he need not release the safety to do so. He merely presses the 10 latch lever 51 into the disabled position of FIG. 6, and opens the bolt with the safety engaged. When he next wishes to reload the rifle, the latch lever should be pressed to release it from the detented disabled condition, so that its normal automatic 15 operation is restored.

The latch lever 51 is preferably positioned near the top of the bolt plug as shown, so that it is readily visible and easily pressed even with a gloved hand,

- 20 but does not protrude in such a location as to be readily subject to accidental operation by the user's hand carrying the rifle, or by jarring against other objects.
- 25 In an alternative embodiment which is not illustrated, the detent notch 70 is not formed in the latch lever 51, and the rear face 53 is left uninterrupted. The cycle of operation would then include only movements between the latched and unlatched positions of FIGS.
- 30 4 and 5. If the hunter wishes to unload live rounds from the rifle when it is in a codked condition, without releasing the safety, he presses the latch lever into the unlatched position of PIG 5, and opens the bolt. The disadvantage of omitting the
- 35 detent notch 70 is that he must use a finger of one hand, which also supports the rifle, to retain the lever 51 in the FIG. 5 position during his action of

10

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

initially opening the bolt by grasping and turning the bolt handle with the other hand. An offsetting advantage of omitting the detent notch is that he need not later reactivate the lever 51 by releasing it from a disabled condition as shown in FIG. 6. When the bolt has been initially turned from the closed toward the open position, the user's finger may be released from the lever 51, and the tooth 52 will slide against the outer periphery of the

10 rotating bolt. Reclosing of the bolt can then be carried out without having to press the lever 51 again, since the tooth 52 will slide back along the outer bolt surface until it falls into the locking notch 62, and assumes the latched position of FIG. 4.

11

RA-0247

12

CLAIM 1. In a bolt-action firearm of the type having a substantially cylindrical bolt rotatably mounted for movement between open and closed positions; a bolt plug non-rotatably mounted and having threaded connection with said bolt; a firing pin mounted reciprocably in said bolt plug for movement between fired and cocked positions with respect to said bolt; the improved bolt latch mechanism which comprises:

- 10 a latch lever having a tooth; said bolt plug being formed with a recess receiving said latch lever; said bolt being formed with a locking notch opening onto an outer peripheral surface thereof at a location radially aligned with said tooth upon rotation of said
- 15 bolt to said closed position; means mounting said latch lever in said recess for pivotal movement substantially radially of said cylindrical bolt between a latched position in which said tooth is engaged in said locking notch to latch said bolt
- 20 against rotation with respect to said bolt plug, and an unlatched position in which said tooth is disengaged from said locking notch to release said bolt for rotation; spring-blased plunger means mounted in said bolt plug for blasing said latch lever toward 25 said latched position;

said latch lever having cam means arranged to project, upon pivotal movement of said latch lever into said latched position thereof, into the path of recipro-

30 cation of said firing pin, whereby movement of said firing pin to said fired position pivots said latch lever to said unlatched position, and movement of said firing pin to said cocked position permits said spring-biased plunger means to pivot said latch lever 35 toward said latched position.

CLAIM 2. A bolt latch mechanism as recited in CLAIM 1, said latch lever having a detent notch, and being

RA-0247

manually pivotable in said recess to a disabled position in which said tooth is released from said locking notch and said detent notch engages said plunger means to interfere with rotation of said latch lever and thereby render said plunger means inoperative to pivot said latch lever toward said latched position thereof.

13

CLAIM 3. A bolt latch mechanism as recited in CLAIM 10 2, said latch lever being manually pivotable from said disabled position toward said latched and unlatched positions thereof, by applying pressure sufficient to displace said plunger means from said detent notch.

- 15 CLAIM 4. A bolt latch mechanism as recited in CLAIM 2, said latch lever having a face area normally bearing against said plunger means for relative sliding movement as said latch lever is pivoted between said latched and unlatched positions, said
- 20 detent notch being formed in said face in a location spaced from said bearing area to engage said plunger means in said disabled position of said latch lever.

CLAIM 5. A bolt 1/afch mechanism as recited in CLAIM 25 2, said latch lever being pivotable: in a first angular direction into said unlatched position; in an opposite angular direction into said latched position; and beyond said unlatched position in said first angular direction into said disabled position.

30

CLAIM 6. A bolt latch mechanism as resited in CLAIM 5, said firing pin being formed with a head having a peripheral surface cylindrical about the axis of movement of said firing pin; said cam means comprising

35 a cam surface formed on said latch lever; said laten lever being constructed and pivotally mounted so that in said latched position thereof, said cam surface is

13

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

5

inclined toward the axis of reciprocation of said firing pin in the direction of movement of said head from said cocked to said fired positions thereof, for sliding engagement by said head surface.

CLAIM 7. A bolt latch mechanism as recited in CLAIM 6, said latch lever being constructed and pivotally mounted so that in said unlatched position thereof, said cam surface slidably engages said head surface 10 and remains inclined to the axis of reciprocation of said firing pin in the direction of movement of said head from said cocked to said fired positions thereof, but at a smaller angle than in said latched position of said latch lever, thereby permitting further 10 pivotal movement of said latch lever in said first angular direction into said disabled position without producing binding interference between said cam surface and said head surface.

20 CLAIM 8. A bolt latch mechanism as recited in CLAIM 2, said latch lever projecting from said bolt plug recess outwardly of said bolt plug, and having a Vshaped upper surface for manual rocking between said disabled position and said latched and unlatched 25 positions.

	-

14

RA-0247

CLAIM 9. In a bolt-action firearm of the type having a bolt rotatably mounted for movement between open and closed positions; a bolt plug non-rotatably mounted and having threaded connection with said bolt; a firing pin mounted reciprocably in said bolt plug for movement between fired and cocked positions with respect to said bolt; the improved latch mechanism which comprises:

- 10 A latch lever having a tooth; said bolt being formed with a notch arranged for receiving said tooth when said bolt is rotated to its closed position; said latch lever being pivotally mounted on said bolt plug for pivotal movement between a latched position in which 15 said tooth is engaged in said notch to lock said bolt against rotation, and an unlatched position in which said tooth is disengaged from said notch to release said bolt; means for biasing said latch lever toward said latched position; said latch lever having cam
- 20 means constructed and arranged to cooperate with said firing pin to pivot said latch lever from said latched to said unlatched position thereof in response to movement of said firing pin from said cocked to said fired position thereof; releasable detent means for
- 25 said latch lever; said latch lever being further pivotally movable to a detented disabled position in which said detent means is operable to releasably secure said latch lever against movement by said biasing means.
- 30

CLAIM 10. A bolt latch mechanism as recited in CLAIM 9, said latch lever being selectively manually pivotable between said detented disabled position and said latched and unlatched positions by applying pressure 35 in alternate angular directions to said latch lever.

15

RA-0247

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

# 16 ABSTRACT OF THE DISCLOSURE

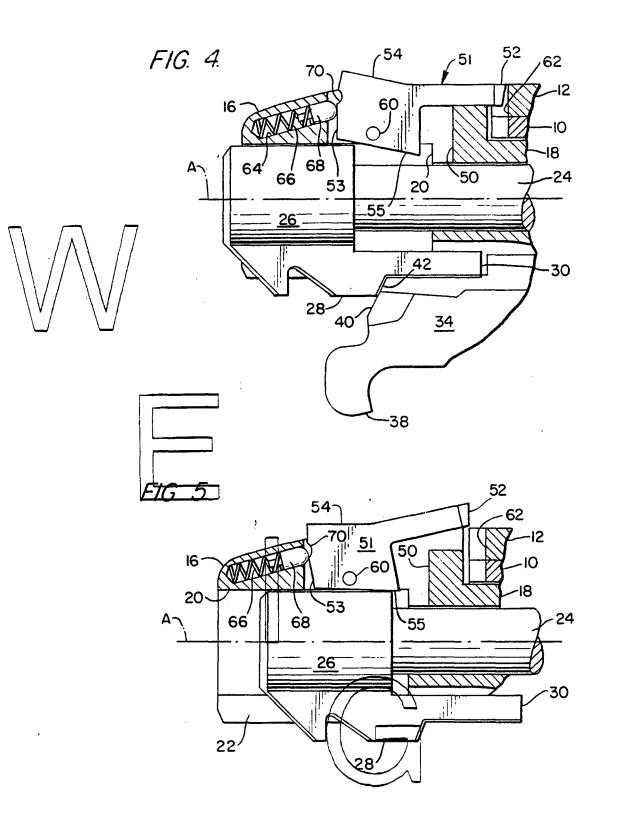

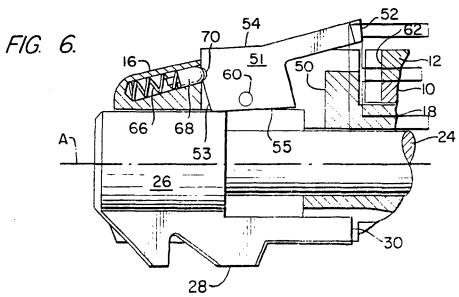

A bolt-action firearm, of the type having a bolt rotatably movable between closed and open positions. has an improved bolt latch mechanism which is operable independently of a safety mechanism. The latch locks the bolt in closed position automatically when the firing pin is cocked, and releases the bolt upon firing. The latch mechanism is recessed in the 10 <u>bolt plug</u> in such fashion that it is readily visible and accessible, yet does not interfere with normal manual operation of the firearm, and does not protrude so that it might readily be displaced accidentally. one embodiment, the latch may be manually displaced to or from a disabled position, in which it is 15 releasably detented.

## SUBJECT: BOLT DATCH FOR BOLT-ACTION FIREARMS RA-0247

I am enclosing a draft patent application for your consideration. Your file copy has copies of the Stahl and Bader patents attached, which are discussed at pages 2 and 3 of the application.

There are several other patents mentioned at pages 1, 2, or 5, including two Walker patents owned by Remington, which relate to the Models 721, 700, etc., and four other patents to Fischer, Williams, Couture, and Brewer that relate to three-position safeties. These are not as pertinent to your invention as Stahl and Bader, and are mentioned only as general background; so I haven't attached copies, but will be glad to supply if you want to see them.

If you find that the application describes your bolt latch accurately and fully, please sign the Declaration attached to the "PTO Copy", sign the Assignment and have it notarized, and return these signed papers for filling in the Patent and Trademark Office.

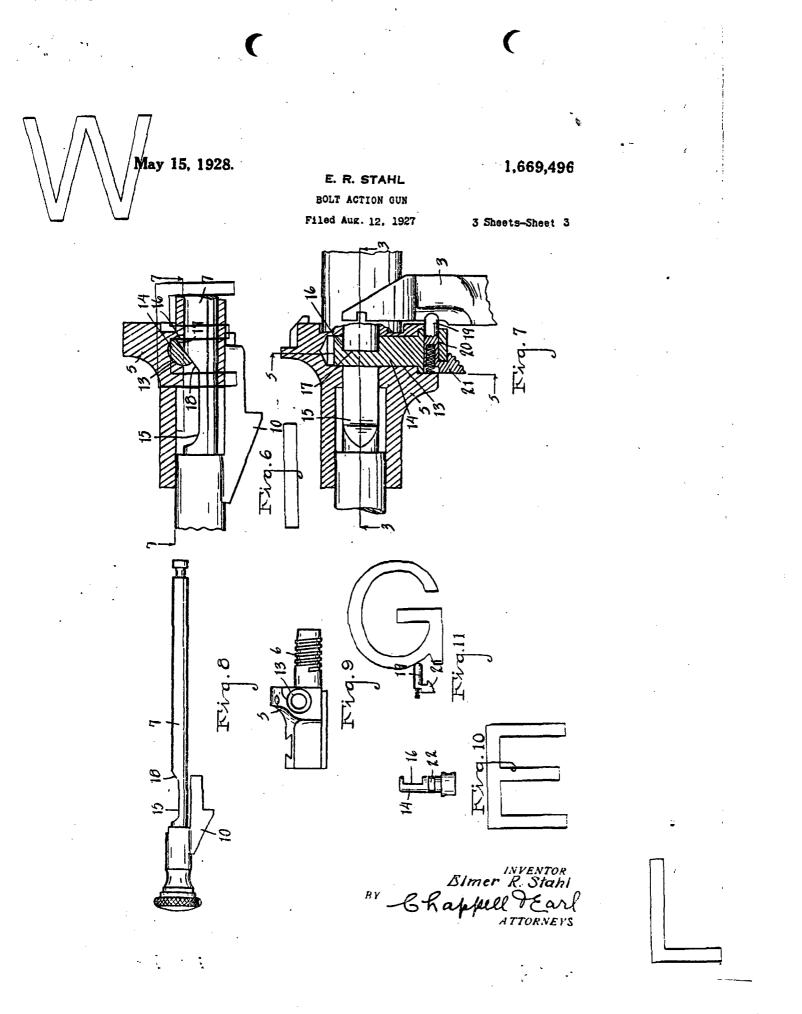

However, if you want to make corrections or additions, please either give me a call, or correct your file copy in pencil and send all the papers back to me for revision.

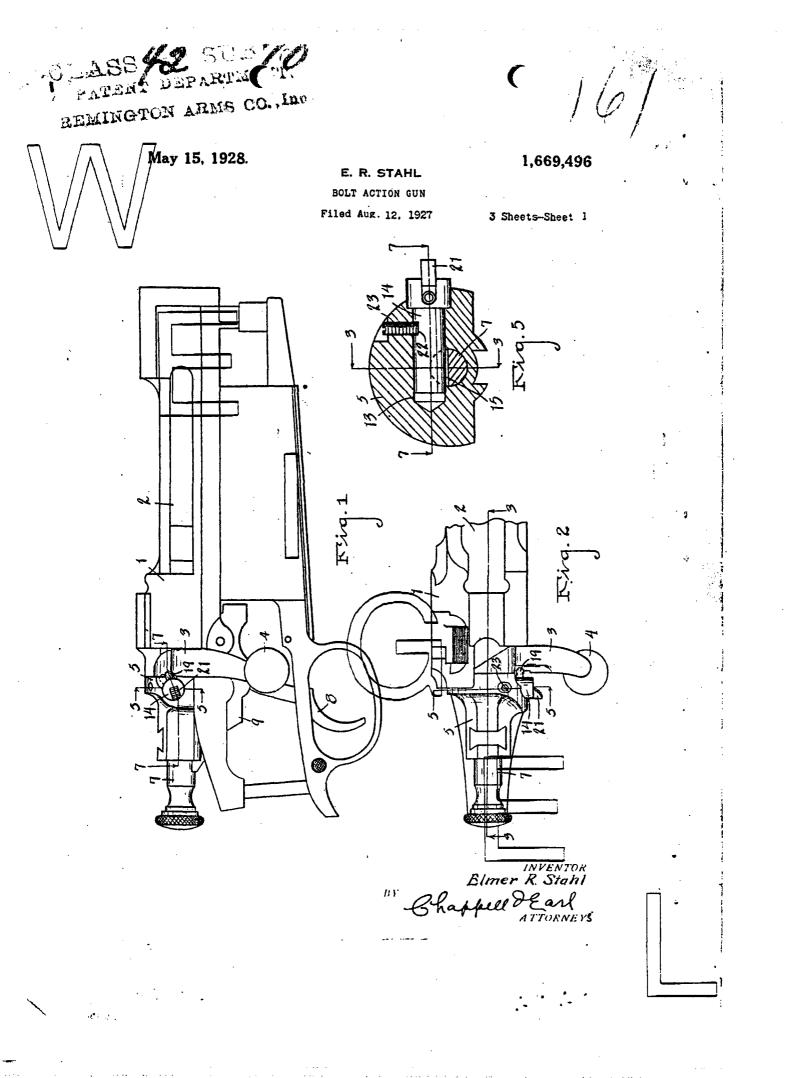

Bill Ericson

## BOLT-ACTION GUN.

## Application filed August 12, 1927. Serial No. 212,493.

The main objects of this invention are: bolt action gans in which the flight of the firing pin is away from and unimpeded by 5 the locking means.

Patented May 15, 1928.

Second, to provide a breech bolt locking means which is automatic in its operation.

Third, to provide an automatic breech bolt locking indans which is capable of manual 10 release.

Fourth, to provide a breech bolt locking means in which the parts are comparatively simple and are so formed and supported that they are not likely to be mured or ren-

15 dered inoperative in use by severe or careless manipulation of the gun.

Objects relating to details and economies of construction and operation of my invention will definitely appear from the detailed 20 description to follow.

The invention is defined and pointed out in the claims.

A structure which is a preferred embodi-ment of my invention is illustrated in the 25 accompanying drawing, forming a part of

this application, in which: Fig. 1 is a side elevation of a gun action

embodying the features of my invention, the stock and barrel and magazine bding so omitted.

Fig. 2 is a fragmentary plan view. Fig. 3 is a longitudinal section on a line corresponding to line 3-3 of Figs. 2.5 and 7, certain parts being shown in full lines 25 for convenience in illustration, the firing pin

being in firing position. Fig. 4 is a fragmentary longitudinal sec-

tion corresponding to Fig. 3 with the firing pin in retracted position.

.10 Fig. 5 is a transverse section on line 5-5of Figs. 1, 2, 4, and 7.

Fig. 6 is an enlarged detail partially in longitudinal section showing the firing pin in retracted or set position, with the breech

bolt locking belt in locking relation thereto. Fig. 7 is a detail view partially in longitudinal section on line 7-7 of Figs. 1, 5 and 6.

45

Fig. 8 is a side elevation of the firing pin 30 with its plunger removed.

Fig. 9 is a side elevation of the non-rotating portion of the breech bolt.

Fig. 10 is a plan view of the locking bolt. Fig. 11 is a plan view of the locking bolt 55 detent and its spring.

In the drawing similar reference char-First, to provide a bolt locking means for acters refer to similar parts throughout the several views, and the sectional views are taken looking in the direction of the little arrows at the ends of the section lines.

Referring to the drawings, 1 represents the body or receiver portion of the breech bolt action. This is a standard commercial type and its structural details need not, therefore, be described.

'The breech bolt 2 is mounted in the receiver for reciprocating and rotary movement as is common with gun actions of this type, the bolt being provided with a laterally projecting arm 3 having a hand piece 4 at 70 its outer end.

The breech bolt sleeve 5 is non-rotatably supported for reciprocating movement with the harrel portion of the breech holt, having threaded engagement therewith at 6.

The firing pin 7 is supported in the breech bolt and its sleeve for movement independ-ently thereof. The trigger 8 is hung from the scar 9 which engages the keeper 10 of The firing pin when the firing pin is retracted 80 or set, is shown in Fig. 4.

The firing pin is provided with an actuating spring 11 and a tappet or plunger 12.

The sleeve 5 is provided with a trans-verse byre 13 to receive and rotatably sup- 85 port the locking bolt 14. the firing pin having an elongated recess 15 to receive this bolf, the bore 13 in part intersecting the firing pin hore 15 in the sleeve 5.

The locking bolt has a segmental recess 16 90 which permits limited movement thereof and provides a flat face 17 coacring with the for-wardly inclined shoulder 18 at the forward end of the recess 15 when the parts are in locking position. the firing pin in this posi- 95 tion, as shown in Fig. 1, cerving as a detent to support the locking bolt against rotation in releasing direction.

The locking bolt is provided with a detent 19 reciprocatingly mounted in a transverse 100 bore 20 in the locking bolt, shown in Fig. 7, to coact with the arm 3 on the breech bolt. This detent is provided with a finger piece 21 which permits manual releasing of the detent should occasion require.

The locking bolt has a transverse kerflike recess 22 engaged by the retaining screw 23 for holding the parts in assembled position

With the parts thus arranged, when the Ho

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

## 1,669,496

the/shoulder 18 of the firing pin is brought provided with a finger piece permitting the into engagement with the locking bolt, serving is a detent to support it against rotation, the parts being then in position shown in Figs. 4, 6 and 7, the arm 3 being engaged by the detent 19 and thereby locked in its a non-rotatable sleeve mounted to reciproinitial position so that the breech bolt cannot be accidentally removed in position to 10 impede the flight of the firing pin.

2

It will be observed that while the firing pin constitutes an element of the locking means, its flight is away from the locking

means so that its movement is not impeded 15 by the locking means, its movement in fact being entirely free or independent from such

locking means. I have illustrated and described my im-provements in an embodiment which is high-to ly practical. I have not attempted to illus-

- trate or describe other embodiments or adaptations as I believe this disclosure will enable those skilled in the art to embody or adapt my improvements as may be desired. Having thus described my invention, what I claim as new and desire to secure by Let-
- 25 ters Patent, is:

1. In a firearm, the combination of a receiver, a breech bolt mounted for reciprocat-

- 30 ing and rotary movement in said receiver and provided with a laterally projecting arm, a non-rotatable sleeve mounted to reciprocate with said bolt, a firing pin operatively associated with said breech bolt and
- said sleeve transversely of said firing pin said firing pin having a transverse recess to receive said locking bolt, the front end of said recess being forwardly inclined pro-
- viding a locking shoulder, said locking bolk having a transverse recess to receive said firing pin. the face of said recess being engaged by the said locking shoulder of the firing pin when the firing pin is in set position, and a
- 45 spring actuated reciprocating detent dis-posed transversely of said locking bolt to engage said breech bolt arm when it is in its initial position, said detent being pro-vided with a finger piece permitting the re-50 leasing of said breech bolt.

2. In a firearm, the combination of a receiver, a breech bolt mounted for reciprocating and rotary movement in said receiver and provided with a laterally projecting

- 55 arm, a non-rotatable sleave mounted to reciprocate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, a locking bolt rotatably mounted in said sleeve transversely of said firing pin,
- 60 said firing pin having a transverse recess to receive said locking bolt, said locking bolt having a transverse recess to receive said ing and rotary movement in said receiver. firing pin, and a spring actuated reciprocat- a non-rotatable sleeve mounted to reciproing detent disposed transversely of said lock- cate with said bolt, a firing pin operatively

breach bolt is actuated to set the trigger, it is in its initial position, said detent being releasing of said breech bolt.

3. In a firearm, the combination of a re-ceiver, a breech bolt mounted for recipro 70 cating and rotary movement in said receiver, cate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, and means for locking said breech bolt com- 75 prising a locking bolt rotatably mounted in said sleeve transversely of said firing pin, said firing pin having a transverse recess to receive said locking bolt, the front end of said recess providing a locking shoulder, said 80 locking bolt having a transverse recess to receive said firing pin, the face of said re-cess being engaged by the locking bolt of the firing pin when the firing pin is in set position. 85

4. In a firearin, the combination of a re-ceiver, a breech bolt mounted for reciprocating and rotary movement in said receiver and provided with a laterally projecting arm, a non-rotatable sleeve mounted to re- 90 ciprocate with said bolt, a firing pin operatively associated with said breech bolt and sleeve, and a locking bolt rotatably mounted in said sleeve transversely of said firing pin to be engaged by the firing pin when the 95 firing pin is in set position, said locking bolt having a spring actuated detent diswsed to engage said breech bolt arm when tively associated with said breech bolt and it is in its initial position, said detent being so sleeve, a locking bolt rotatably mounted in manually releasable. 100

5. In a firearm, the combination of a receiver, a breech bolt mounted for recipro-cating and rotary movement in said receiver, a non-rota able sleeve mounted to reciprocate with shid bolt, a firing pin operatively 105 associated with said breech bolt and sleeve, and a locking member for said breech bolt rotatably mounted in said sleeve transversely of said firing pin to be engaged by the firing 110

pin when the firing pin-is in set position. 6. A firearm comprising a rotary and re-ciprocatory breech polt. a non-rotating sleeve reciprocating with the bolt a firing pin reciprocating with the sleeve and bolt and movable relative to said parts, and means 115 for locking said holt in firing position comprising a locking member mounted on said sleeve to cooperate with said bolt, said firing pin cooperating with said locking member to hold the same in bolt locking position 120 when the firing pin is in set position, the flight of the pin being away from said locking means whereby its movement is unimpeded by the locking means.

7. In a firearm, the combination of a re- 125 ceiver, a breech bolt mounted for reciprocat-45 ing bolt to engage said breech bolt arm when associated with said breech bolt and sleeve, 130

and a locking member for said breech bolt tively associated with said breech bolt, and mounted in said sleeve to be engaged by the a breech bolt locking means operatively asfiring pin when the firing pin is in set position.

84 A firearm comprising a rotary and reciprocatory breech bolt, a non-rotating sleeve reciprocating with the bolt, a firing pin operatively associated with said bolt and sleeve and movable relative thereto, and means for locking said breech bolt in firing

- . 10 position comprising a locking member mounted on said sleeve to cooperate with said breech bolt, said firing pin cooperating, when in set position, with said locking mem-
  - <sup>15</sup> ber to hold the same in breech bolt locking position, the flight of the firing pin being away from said locking member whereby its movement is unimpeded by the locking means. 20
  - 9. A firearm comprising a rotary and reciprocatory breech boll, a non-rotating sleeve reciprocating with the bolt, a firing pin operatively associated with said bolt and sleeve and movable relative thereto, and <sup>25</sup> means for locking said breech bolt in firing
  - position comprising a locking member mounted on said sleeve to cooperate with said breech bolt, said firing pin cooperating, when in set position, with said locking mem-

<sup>30</sup> ber to hold the same in breech bolt locking position.

10. A firearm comprising a rotary and reciprocatory breech bolt, a firing pin operatively associated therewith, and a breech bolt locking means cooperating with said fiv

- ing pin when the firing pin is in set position to lock the breech bolt, the firing stroke of said firing pin being away from said locking means. 40
- 11. A firearm comprising a rotary and ve ciprocatory breech bolt, a firing pin opera- and potary movement, a firing pin opera-tively associated therewith, and a breech tively associated with said breech bolt, and bolt locking means, said firing pin when in
- set position constituting a detent for the breech bolt locking means, the firing stroke of said firing pin being away from said locking means.

12. A firearm breech bolt action compris- my hand. ing a breech bolt mounted for reciprocatory and rotary movement, a firing pin opera-

sociated with said breech bolt and firing pin, the firing pin acting when set to hold said locking means in locked position, the flight 55 of the firing pin being away from and unim-peded by said locking means.

13.' A firearm breech bolt action comprising a breech bolt mounted for reciprocatory and rotary movement, a firing pin opera- 80 tively associated with said breech bolt, and a breech bolt locking means operatively associated with said breech bolt and firing pin, the firing pin acting when set to hold said locking means in locked position. 65

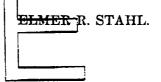

14. A breech bolt firearm action consisting of a breech bolt, automatic means for, locking said breech bolt in initial position after actuation to set the firing pin, and a firing pin constituting a detent for said lock- 70 ing means, the flight of the firing pin being free and unimpeded by said locking means.

15. A breech bolt firearm action consisting of a breech bolt, automatic means for locking said breech bolt in initial position 75 after actuation to set the firing pin, and a firing pin constituting a detent for said locking means.

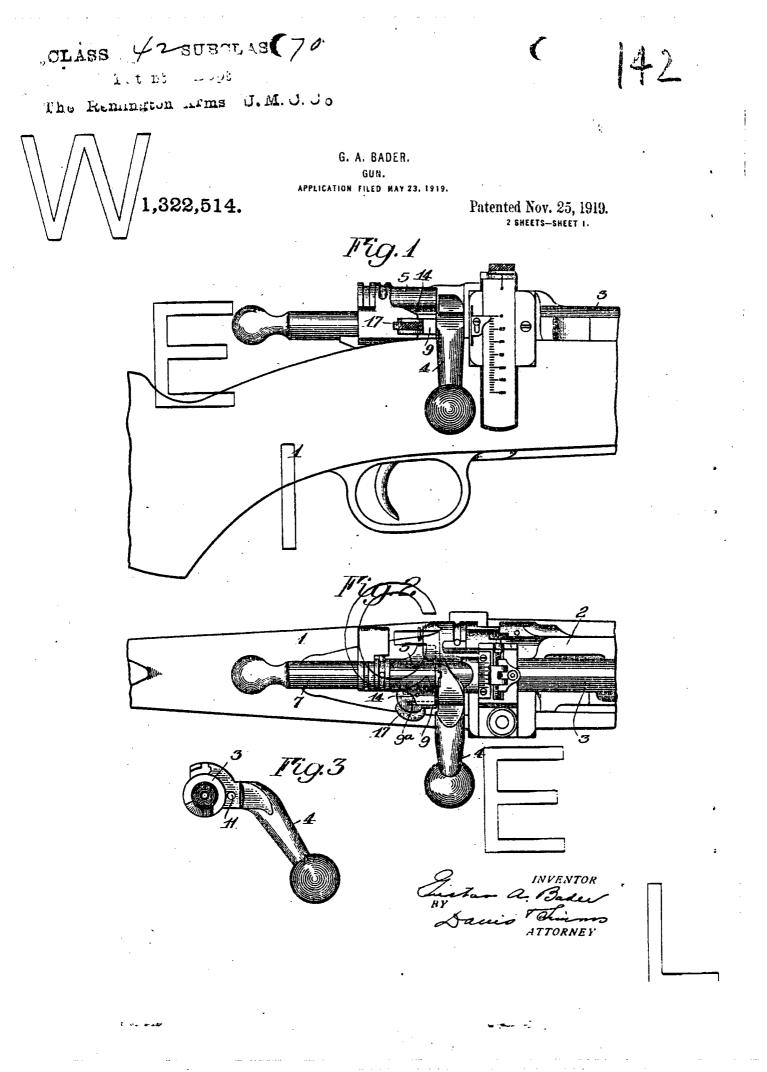

16. A firearm breech bolt action comprising a breech bolt mounted for reciprocatory 80 and rotary movement, a firing pin opera-tively associated with said breech bolt, and a breech bolt locking means operatively associated with said breech bolt and firing pin the firing pin constituting a detent for <sup>85</sup> said locking means, the flight of the firing pin being free and unimpeded by said locking mean

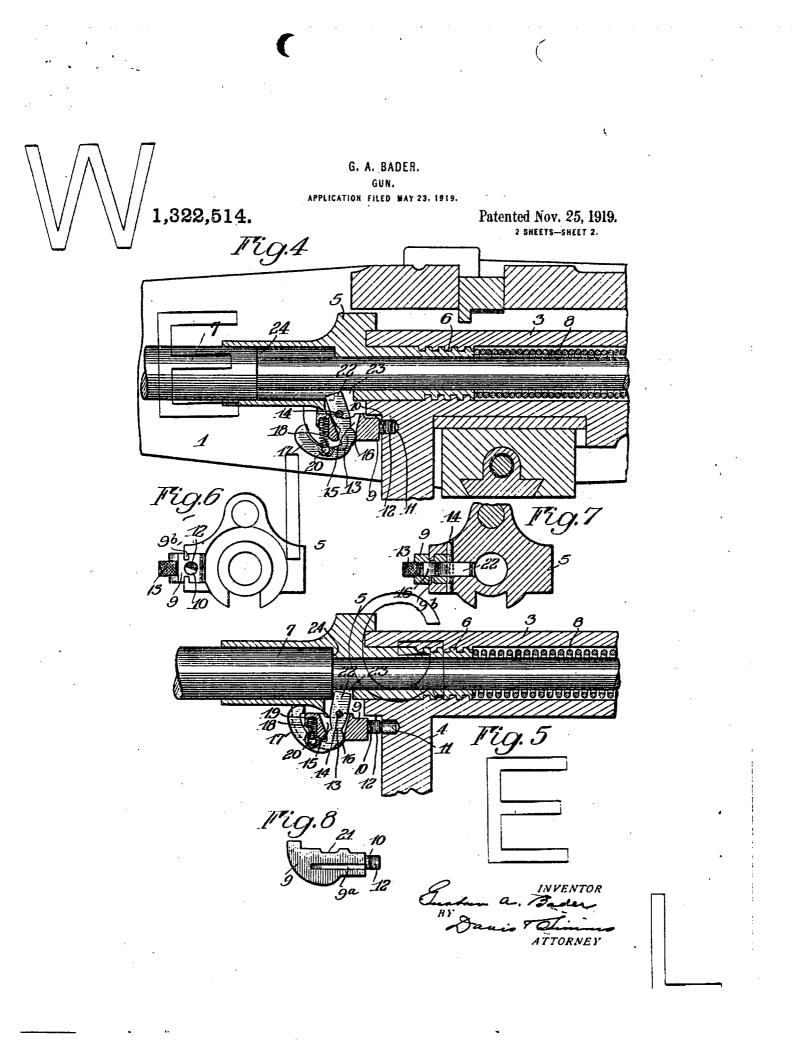

17. A firearm breech bolt action comprising a breech bolt mounted for reciprocatory a breech bolt locking means operatively associated with said breech bolt and firing pin. the firing pin constituting a detent for said 95 locking means.

In witness whereof I have hereunto set

3

## STATES PATENT OFFICE. NPTED.

## GUSTAV A. BADER, OF ROCHESTER, NEW YORK.

## GUN.

#### Specification of Letters Patent. Patented Nov. 25, 1919.

Application filed May 23, 1919. Serial No. 299,103.

To all whom it may concern:

2,514.

Be it known that I, GUSTAV A. BADER, a citizen of the United States, and resident of Rochester, in the county of Monroe and 5 State of New York, have invented certain

new and useful Improvements in Guns, of which the following is a specification. The present invention relates more par-

- ticularly to the type of guns in which a re-10 ciprocatory holt mechanism carries a spring pressed firing pin and is provided with a portion which rotates to lock the bolt mechanism in firing position, an object of this in-
- vention being to lock the rotary part of the 15 bolt mechanism against movement while in firing position and preferably to control such locking means automatically through the firing of the gun.
- To this and other ends, the invention con-20 sists of certain parts and combinations of parts all of which will be hereinafter described, the novel features being pointed out in the appended claims. In the drawings:

- Figure 1 is a fragmentary side view of 25 a gun equipped with the present invention Fig. 2 is a fragmentary top view of said gun
- Fig. 3 is a rear view of the breech bolt; Fig. 4 is a horizontal sectional view 30 through a portion of the gun in the plane of the axis of the firing pin showing the locking device locking the breech bolt in
- closed position; Fig. 5 is a detail sectional view of the 35 firing pin engaging the locking device and holding said locking device out of connec-tion with the breech bolt;

Fig. 6 is a detail view of the sleeve which 40 connects with the rear end of the breech bolt;

Fig. 7 is a vertical transverse section through said sleeve showing the manner in which the locking device is mounted on the 45 sleeve; and

Fig. 8 is a detail view of one member of the locking device.

The invention herein is illustrated in the U. S. magazine rifle, model of 1903, which is

50 described in publication #1923 of the Ordnance Department U. S. A., revised Febru-ary 14, 1908, entitled "Description and Rules for the Management of the U.S. Magazine Rifle, Model of 1903, Caliber .30," and ref-

55 erence may be had to this publication for

any parts of the rifle which are not herein shown as it is unnecessary to illustrate in detail such a rifle in view of the fact that the invention is confined to an addition to the same. It will be understood however, that 60 the invention is not limited to a rifle such as shown in the above montioned publication but may be embodied in any construction where similar results are desired.

In rifles of the type mentioned, unless the 65 bolt handle is turned fully down, the cam on the cocking piece will strike the cocking cam on the bolt and the energy of the main spring will be expended in closing the bolt, instead of on the primer; this prevents the 70 possibility of a cartridge being fired until . the bolt is fully closed, (see page 30 of the publication above referred to). In most instances, the bolt handle is turned fully down but is afterward unintentionally and un- 75 knowingly shifted slightly in an upward direction so that when the trigger is pulled the firing does not take place. It will be readily understood that this is not only a disadvantage to an army in battle but it is 80

also a dhadvantage to a hunter who, after roaming many hours, and may be days, neets game only to lose it through misfire due to the upward shifting of the bolt handle of which he had no knowledge. According to \$5 this invention the turning of the rotary part of the bolt mechanism is prevented by a locking device which automatically enters into locking position to lock the rotary portion of the bolt mechanism, this locking de- 90 vice being automatically shifted out of locking position when the gun is fired.

Referring to the embodiment of the in-vention herein shown, 1 indicates the stock of the gun and 2 the receiver on which the 95 bolt mechanism is reciprocable. This mechanism comprises in this instance a breech block 3 reciprocable and rotatable in the well of the receiver and interlocking with the receiver by a rotary movement under the 100 action of the handle 4, a sleeve 5 being guided on the receiver to be held against turning with the bolt and having a screw threaded connection 6 with the bolt. Carried by the sleeve and the breech bolt is a firing pin 7 which is acted upon by a main spring 8 of helical formation surrounding the firing pin. The foregoing parts are the known parts of the U.S. magazine rifle above mentioned.

1,322,514

2

As before pointed out, the handle 4 on the/breech bolt 3 is shifted accidentally at times away from its lowered position where it locks the breech bolt to the receiver, thus causing the energy of the main spring of the filting pin to be used up in closing the bolt instead of acting on the primer with full force. According to the illustrated embodiment of this invention, means is provided 10 for locking the breech bolt in its innermost position interlocked with the receiver. This means in this instance comprises a de-1 mis means in this instance comprises a detent <u>9 preferably</u> slidably mounted on the sleeve <u>5 at one cill</u>e of the latter by form15 ing grooves 9<sup>a</sup> in the upper and lower surfaces of the detent and projecting ribs 9<sup>b</sup> on the sleeve to fit into said grooves 9<sup>a</sup>. This detent may have a nose 10 adapted to enter

- a recess or notch 11 formed in the rear face 20 of the <del>solt arm 1,</del> the uppermost face of the nose <del>10 being bev</del>eled at 12 so that when the bolt arm 4 is swung to its lowermost position, it will cooperate with the cam face 12 and move the latter rearwardly, after which 25 the detent 9 will move under the action of
- a spring to be described, so that the nose 10 enters into the notch 11 and locks the bolt arm 4 in its lowermost position so that the bolt is held interlocked with the receiver.
- The detent 9 may be controlled either manually or automatically, the latter be-ing accomplished preferably through the 30 firing pin 7. To these ends, a lever 13 may be pivotally mounted at 14 in the sleeve 35 5 and extend through an opening 15 in the detent 9, the lever having on opposite sides curved faces 16 acting as curved beavings for engaging opposite walls of the opening 15. On the outer side of the detent, the
- 40 lever 13 may have a curved arm 17 and between this arm 17 and the detent, a helical spring 18 may be arranged, said spring be ing received within a pocket 19 in the detent 9 and a rocking projection 20 on the 45 inner face of the arm 17. It will be appar-
- ent that this spring 18 acts on the operating lever 13 to shift the latter in a direction to move the detent 9 toward the arm 4 of the breech bolt 3. The pivot pin 14 may 50 act as a stop for limiting the movement of
- the detent 9 and to this end the inner face of the detent is provided above and below the lever 13 with notches 21 in which the pivot pin 14 is received, the ends of these
- 55 notches serving to limit the movement of the detent 9 on the guides of the sleeve 5. It will thus be apparent that the pin 14 not only holds the lever 13 to the sleeve 5 but also retains the detent on the sleeve 5 and
- 60 therefore the removal of this pin 14 permits the removal of the two parts as well as the spring arranged between such parts.
- The control of the detent 9 through the firing pin is preferably effected by provid-55 ing an extension 22 on the lever 13 which

projects through an opening 23 in the sleeve into the path of the usual shoulder 24 on the firing pin. When the firing pin is in its innermost position in the sleeve 5, this shoulder 24 engages the extension 22 of 70 the lever 13 and moves the lever 13 in a direction to carry the detent out of interlocking connection with the arm 4 of the breech bolt, as will be seen more clearly by referring to Fig. 5 of the drawings, thus 75 permitting the breech bolt to be rotated to become unlocked from the receiver in order that the bolt, the sleeve and the firing pin may be moved rearwardly after the firing pin is cocked. The shoulder 24 moves away 80 from the extension 22 permitting the end 22 to shift rearwardly under the action of the spring 18 and in this way to project the detent 9 forwardly so that when the arm 4 of the breech bolt is moved downwardly, 85 it will cooperate with the beveled end 12 of the detent shifting the latter to the rear so that the nose 10 may enter into the notch 11, thus locking the arm 4 of the breech bolt in the lower position. In this position 90of the detent it may be moved rearwardly manually by pressing on the extension 17 of the lever 13 or it may be moved rear-wardly automatically by shifting the firing pin to its innermost position in the sleeve 5, 95 when the shoulder 24 will engage the lever extension 22 and through the lever shift the detent 9 to the rear.

From the foregoing it will be seen that here has been provided a locking device 100 which locks the rotary part of the bolt mechanism in interlocking connection with the receiver, thus preventing the accidental shifting of the bolt mechanism to an inoperative position. This locking device is con-trollable either manually or automatically so as to release the bolt mechanism. The automatic control is preferably effected through the firing of the gun due preferably to the shifting of the firing pin in firing, 110 the firing pin engaging with a lever which shifts the detent out of locking position. What I claim as my invention and desire

to secure by Letters Patent is:

1. A firearm of the type in which the 115 breech mechanism has a sliding movement in the receiver and a portion which rotates to lock the mechanism in firing position, dis-tinguished by a locking device which locks the rotary part against rotary movement, 120 and is operated automatically to release the rotating part on the firing of the gun.

2. A firearm of the type having a recipro catory bolt mechanism provided with a fir ing pin movable with said bolt mechanism 125 and also relatively thereto and also with a portion rotatable to lock the bolt mechanism in firing position, distinguished by a locking device for locking the rotary por-tion against rotary movement, said locking 130

device being controlled by the firing pin to release the rotary portion on the firing of the gun.

3/A fircarm of the type having a reciprototory bolt, a sleeve reciprocating with said breech bolt but held against rotation with the bolt, distinguished by a locking device which is carried by the sleeve, coöperates with the breech bolt to hold the latter 10 against rotation and is operated automati-

cally on the firing of the gun to release the breech bolt.

4. A firearm of the type having a rotary and reciprocatory breech bolt, a sleeve re-15 ciprocating with the bolt but held against rotation therewith, and a firing pin moving with the sleeve and the breech bolt and also

relatively to said parts, distinguished by a

locking device for holding the breech bolt against rotation, said locking device being 20 mounted upon the sleeve and controlled by the firing pin.

5. A firearm comprising a rotary and reciprocatory breech bolt, a sleeve reciprocating with the bolt but held against rotation 25 with said bolt. a firing pin reciprocating with the sleeve and the bolt and also movable relatively to said parts, a detent slidably mounted upon the sleeve and adapted to coöperate with the breech bolt to hold the 30 latter against turning, and a lever mounted on the sleeve and having a manually operable portion and also a portion arranged to be operated by the firing pin.

#### SUBJECT: BOLT LATCH - RA-0247

Enclosed is a revised draft patent application on your invention, which covers the alternative of omitting a detent notch from the latch lever. The principal changes are on pages 3 (discussion of Stahl and Bader Patents modified); 4 (detent described as applicable to only one embodiment); 10 and 11 (please consider carefully whether the comparisons drawn between the alternative versions are valid); the Claims on pages 12-15; and the Abstract on page The other pages are unchanged. 16.

If you are satisfied that the description is adequate and accurate, please sign the Declaration attached to the "PTO copy", sign the Assignment and have it notarized, and return these papers for filing in the Patent and Trademark Office. But if changes are needed, please give me a call. I'll be in Ilion on July 22nd, and can discuss this more fully then if you wish.

Re:	M-700 Fire Control

Test results of April 8, 1981 show that the fire control performance is acceptable. I feel more testing is needed to prove conclusively our system is best.

I will order 30 fire controls fabricated and tested. With proper priority this can be completed by October 1, 1981.

## <u>M/700 Trigger Assembly</u> Present Trigger Assembly vs. Proposed New Trigger Assembly

A high spot economic evaluation has been completed using the 1981 M/700 forecast comparing the present M/700 Trigger Assembly to a proposed new designed Trigger Assembly. The safety is revised in the proposed new Trigger Assembly, cutting off the locking arm and adding a countersink to actuate the new safety planger when the "safe" is on. New designed side plates, trigger and a new stop screw and spring completes the proposed new Trigger Assembly.

The attached economic sheet/indicates an annual cost increase of \$35,270 in operating cost. A cost increase of \$16,800 after amortization of operation charges of \$16,500 will be realized with total capital required of \$20,060.

## TEST PROCEDURE - CONT'D.

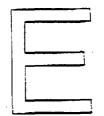

5.

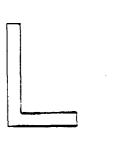

The rifles were then subjected to another Safe On/Off dry cycle test. They were brought to the 5,000 cycle level. (2,500 additional cycles) Safe on/off measurements were taken every 500 cycles and sear lift and engagement wear measured at the 5,000 cycle level.

These same procedures were followed until live fire totaled 2,500 rounds per rifle and safe On/Off dry cycle totaled 7500 cycles per rifle.

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

Report No. 812441

1.144

4) new trigger assemblies were subjected to the following trick test:

- $| \rangle$  Place Safety Switch in the Safe "On," position.
- Close the bolt.

112

- Put constant pressure on the trigger attempting to fire the rifle.
- Push the Safety Switch from the "On" position to the "Off" position.
- Does the firing pin fall?

All four (4) New Design Trigger Assemblies with the trigger /sear blocked passed this test. In all four (4) guns the firing pin did not fall.

<u>NOTE</u>: The measurements recorded for the Safe On/Off forces are questionable. There is no way to determine if they are within Remington Standards, because there are no standards written for these forces with this fire control assembly. The only Remington Standards written for Safe On/Off forces, pertain to the common fire control. That Standard is:

4 – 8 lbs. – One sharp click Double click not allowed

The Safe On/Off forces measured in this test range from 5.25 lbs to 10.2 lbs. – almost a 5 lb. difference. (Refer to Appendix A, Data Sheets No. 1 – 5 for all Safe On/Off measurements).

## TEST PROCEDURE

## A. MEASUREMENTS

The following measurements were taken on the five rifles used in this test:

- Headspace
- Firing Pin Indent
- Trigger Pull
- Sear Lift
- Sear Engagement
- Safe On/Off Forces

## B. TEST CONDITIONS

- 1. After every 20 rounds fired, the safety was checked. This was done by holding the trigger and pushing the safety switch from safe to fire.
- 2. After 1,000 rds. of live fire all the rifles were cleaned and they were remeasured. (Jack Shooting).
- 3. The rifles were then subjected to Safe On/Off dry cycle. Each rifle was cycled for 2,500 cycles, with Safe On/Off measurements taken every 500 cycles and Sear Lift and Engagement at the 2500 cycle level.
- 4. The rifles were then live-fired to the 2,000 round level. (Jack Shooting) Measurements were taken at this level.

	NEW DESIGN M/700

NEW DESIGN M/700 TRIGGER/SEAR BLOCK EVALUATION

## ABSTRACT:

A total of (5) M /700 Fire control assemblies with the New Design safety assemblies, were delivered to the Test Lab by Fred Martin for testing. This safety assembly blocks the trigger and the sear so that the firing pin won't fall when the trigger is held back while the safety switch is pushed from the safe to fire position. Both dry cycle and live fire endurance tests were used to test the assemblies. A M/700 fire control assembly (Current Production) was used as a control and (4) out of the (5) New Design assemblies were used in the test.

## SCOPE OF TEST

To evaluate the functional performance of the New Design safety assembly, in the M/700 Rifle during lab testing.

## TEST RESULTS

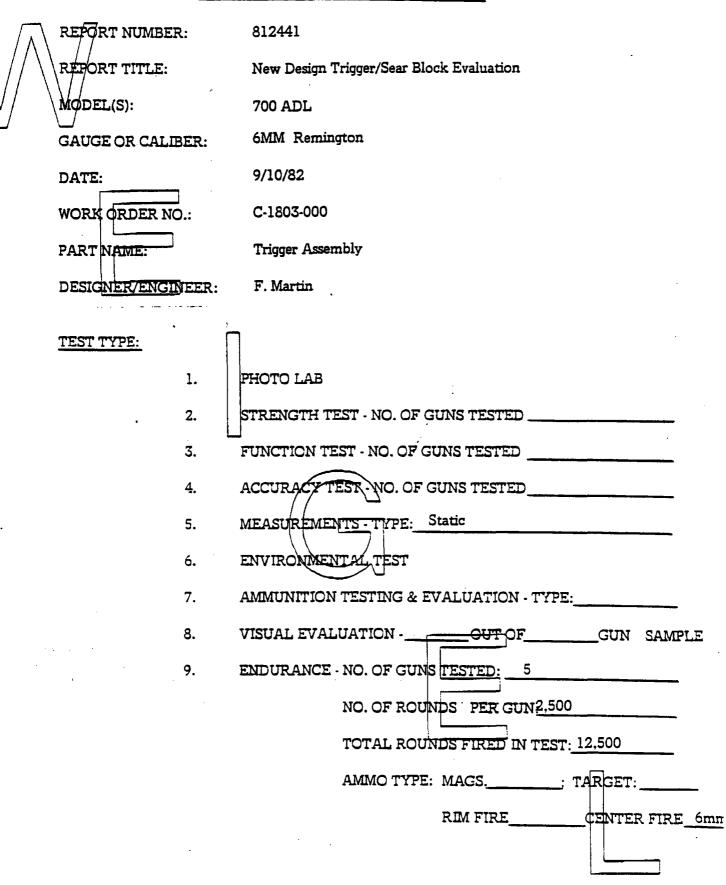

No functional problems arose during testing. Both the New Design safety and the control functioned normally. There was no significant change in the safe On/Off forces measured before, during and after testing, on all the assemblies, including the control

On Friday, February 26, 1982 the Plant will remove from the Production area and the Custom Shop all safety assemblies with the bolt lock arm. They will be delivered to Arms Service. All new trigger assemblies will have the bolt lock removed.

Beginning February 26 all Model 700 rifles (Right and Left Hand) 40XB, 40XC, 40BBR and 40XR rifles that are returned to Production should be tagged to identify them if they have a safety with the bolt lock arm.

CC: J. S. MARTIN (No Attach.) C. B. WORKMAN (No Attach.)

REMINGTON ARMS COMPANY, INC.

BRIDGEPORT, CONNECTICUT

JANUARY 4, 1982

FRED MARTIN BOLT ACTION SAFETY WITH SEAR AND TRIGGER BLOCKS RE:

A preliminary patent search has been made on the trigger assembly shown in your drawing of February 10, 1981 (unnumbered), which shows a Model 700 sear-blocking safety with the addition of a spring-biased trigger block plunger (SKB-3633). This plunger is slidable transversely in a hole through the trigger; it has an enlarged tip which is depressed by the safety lever into locking engagement with the trigger in the "safe" position, but releases the trigger by seating in a conical recess in the safety lever in the "fire" position.

My search did not disclose any competitively-owned patents that would pose any infringement risks in connection with your design. While other types of safeties were found that block both the sear and the trigger, I believe that patent protection may be obtainable in the event your design is used.

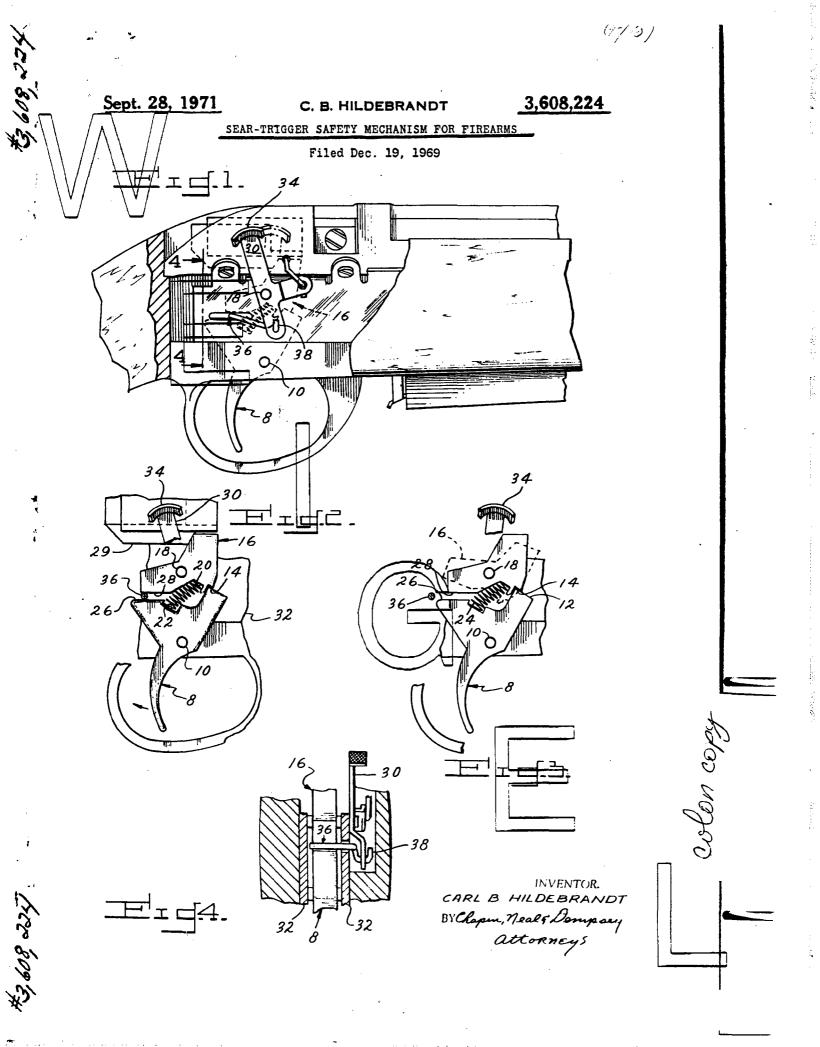

Hildebrandt Patent 3,608,224 shows a safety lever 30 which carries a bent rod 36, and in the "safe" position, slides this rod between opposed surfaces of the sear 16 and trigger 8 to block movement of either.

Horsrud Patent 2,310,238 has a safety slide 123 formed with a vertical arm whose extremities 122, 125 are engaged with the sear 66 and the trigger 87 to block movement of either, when the slide is moved to the "safe" position.

These references are representative of the state of the art; no patent has been found that discloses a system equivalent to yours.

3,608,224 SEAR-TRIGGER SAFETY MECHANISM FOR FIREARMS B. Hildebrandt, Springfield, Mass., assignor to / Emhart Corporation, Bloomfield, Conn. Filed Dec. 19, 1969, Ser. No. 886,716 Int. Cl. F41c 17/00, 17/08 U.S. Cl. 42 -70C

6 Claims

#### ABSTRACT OF THE DISCLOSURE

Safety mechanism for firearms having a trigger and sear combination in which the trigger has a portion engaged in a notch of the sear when the trigger is in its rest position. The trigger and sear are each pivotable for release of the trigger from the notch of the sear and include

#### BACKGROUND

Safety mechanism for guns are available in a wide variety of types. In general, such safety mechanisms include a block, lever or pin which is moved or swing into block-ing engagement with the hammer, sear, trigger or bolt of the gun. All too frequently guns have been fired and peo-ple killed or wounded when the safety was "thought to be on." Analysis of many of these accidental firings has shown that in some cases the critical portion of the safety had been broken or distorted as a result of the gun being dropped or sustaining some other sharp impact when the safety was "on." Of course, if the operative portion of the safety is damaged or broken, the safety is generally ren dered inoperable or imperfectly operable. In many stances the end of a safety lever or pin has been sheared off permitting inadvertent discharge of the gun, since uspally such damage is not known to the operator.

It is the principal object of this invention to provide safety which is simple in construction and operation while being most reliable and effective in its operation.

Another object of this invention is to provide a safet in which the operative portion thereof is not subject to shear or bending forces when in a "safe" position. The above and other objects of this invention will be

more readily apparent from the following description and with reference to the accompanying drawings, in which: 50

FIG. 1 is a side elevational view of a portion of a gun partially in section showing a safety embodying this invention;

FIG. 2 is a partial elevational view showing the safety in FIG. 1 in greater detail;

FIG. 3 is a view similar to FIG. 2 with the safety in different operative relationship; and

FIG. 4 is a section taken along line 4-4 of FIG. 1.

The gun comprises a trigger 8 pivotable about a pin 10. The trigger includes a latch portion in the form of 60 a tooth or shoulder 12 forward of the pivot 10 for interlocking engagement with a notch 14 in sear 16. The sear 16 is mounted for pivotable movement about a pin 18 which is located above the trigger pivot pin 10. The trigger and sear are each provided with recesses 20 and 22 to 65 receive the outer ends of a compression spring 24 which urges toward counterclockwise rotation both the trigger and sear. The spring serves as the trigger spring and to return the trigger and sear to their rest positions (FIG. 2) after firing.

The outer surface of shoulder 12 of the trigger is configured for surface to surface engagement with the op2

posed surface portion of the sear, so that when the trigger is pulled or rotated clockwise, the sear will be rotated counterclockwise through a small angle before the shoulder 12 of the trigger clears the sear notch.

Rearward of their respective pivot pins the trigger and sear each include ledges 26 and 28 respectively, which are in spaced opposed, generally parallel relationship when the action is cocked, as shown in FIG. 2. When the trigger is pulled, the ledges move toward each other until the 10 shoulder 12 clears the sear notch 14. When released, the sear is rotated clockwise by the movement of striker lug 29 moving forward for firing the gun. The bolt and striker mechanism may be of the same general type as disclosed in U.S. Pat. No. 2,765,562, issued on Oct. 9, 15 1956.

lease of the trigger from the noton of the scal and instant spaced opposed portions movable toward each other on said release of the trigger. A safety which has a portion movable between the spaced opposed portions of the trig-ger and sear and which is in compression therebetween the trigger. A safety have to pull the trigger. In accordance with this invention the safety comprises tively. Adjacent its lower end, this safety lever is connected to a rod 36.

As best shown in FIGS. 1 and 4, the lever 30 has an 25 aperture adjacent its lower end for receiving the outer end portion of the rod 36. In the embodiment shown, the outer end of the rod is provided with a hook 38 of generally U-shaped configuration by which the lever is drivingly coupled to the rod. From the hook portion 38 the rod 30 extends rearwardly and generally parallel to the path of movement of the safety lever 30 and then transversely or laterally to the direction of movement of the lever 30. The rod 36 is movable from a position in which it is interposed between the opposed ledges 26 and 28 of the sear 35 and trigger to a position in which it is clear of the path of pivotal movement of the sear and trigger (FIG, 3).

The rod may be made of any suitable material of sufficient highlity and strength to serve as a safety without dis-40 tortion or breaking. It has been found that metal wire or od stock, such as steel wire on the order of 1/16"-3/32 in-diameter is suitable. The rod stock material selected may be somewhat softer than the steel of the sear and trigger so that in effect it cushions or absorbs any impact or shock transmitted from one to the other of these parts, thereby further minimizing the possibility of breakage or damage. It is important that the diameter of the rod or wire stock be sufficient to block any substantial pivotable movement of the sear or trigger, otherwise the trigger will be released from the sear notch. The diameter should also be such that it will be readily accommodated in the space between the two ledges 26 and 28.

When it is desired to place the safety "on," the actuator 34 of lever 30 is simply moved rearward. Since the lower 55 end of the lever is coupled to safety rod 36 by its hook portion 38, the transverse portion of the rod is carried into a blocking position between the rear ledge portions 26 and 28 of the trigger and sear, as shown in FIGS. 2 and 4. In this position, any attempt to fire the gun by pulling the trigger is entirely blocked, as is also movement of the sear. A simultaneous and mutual blocking of the sear and trigger is thereby achieved since as previously mentioned, to release the sear, the trigger must move clockwise while the sear must move counterclockwise. Thus, with the safety "on" when a firing pull is exerted on the trigger, the transverse portion of the rod is "squeezed" or in compression between the ledge portions 26 and 28 of the trigger and sear respectively.

When it is desired to fire the gun, the actuator 34 of 70 the safety lever is moved forward, whereby the lower end of the lever moves the safety rod 36 rearwardly until it is clear of the path of rotation of the trigger and sear.

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

5

30

3

Thereafter when the trigger is pulled, its sear engaging portion 12 moves out of the sear notch 14 and the striker lug 29 under influence of the striker spring (not shown) pivots the sear clockwise, as shown in dotted lines in FIG. 3, as the striker moves forwardly to fire the gun. The coil spring 24 then serves to return the trigger and sear to their rest positions and operation of the bolt will again cock the gun as shown in FIG. 2.

Inasmuch as the safety rod is disposed between the opposed surfaces of the sear and trigger, which in the 10 particular embodiment is on the order of  $\frac{3}{16}$ " in width, the likelihood of damage or breakage of the safety, or the engaged portions of the firing mechanism from a sharp impact to the gun is for all practical purposes eliminated.

Having thus disclosed the invention, what is claimed is: 15 1. Safety mechanism for a gun having a striker releasably retained by a sear and trigger combination, said trigger and sear being pivotable in opposite directions and each including spaced opposed surface portions pivotable toward each other for release of the sear on firing move-20 ment of said trigger, and a safety including a portion selectively movable into and out of blocking relation between the opposed surface portions of the sear and trigger, said safety when in blocking relation simultaneously preventing firing movement of the trigger and sear. 25

2. Safety mechanism as set forth in claim 1 in which said safety comprises a rod, which when in blocking engagement between the trigger and sear is in compression against firing movement of the combination of the trigger and sear.

3. Safety mechanism for a gun having a striker releasably retained by a sear and trigger combination, said trigger including a shoulder and said sear including a notch for releasably receiving the shoulder of the trigger, said trigger and sear being pivotable in opposite directions and <sup>25</sup> each including spaced opposed surface portions pivotable toward each other for release of the sear and said trigger, L

and a safety including a portion selectively movable into and out of blocking relation of said opposed surfaces of the sear and trigger, said safety when in its blocking relation simultaneously preventing movement of the trigger and sear whereby the shoulder is retained in the notch of said sear.

4. Safety mechanism as set forth in claim 3 in which said safety includes a pivotable lever and a rod drivingly coupled to said lever, and a portion movable into and out of blocking relation between said spaced opposed portions of the trigger and sear.

5. Safety mechanism as set forth in claim 3 in which the trigger and sear are pivotable at points, one generally above the other, said shoulder of the trigger and the notch of the sear being disposed to one side of said pivot points, said opposed surfaces being in the form of ledges disposed to the opposite side of said pivot points, the rod of said safety including a portion movable into and out of blocking relation between said ledges for simultaneously blocking pivotable movement of the sear and trigger, and being in compression when preventing said gun from being fired when said gun is on "safe."

6. Safety mechanism as set forth in claim 5 in which said safety comprises a pivotable lever with a metal rod coupled to said lever and with a transverse portion disposed for blocking movement of said sear and trigger when the gun is on "safe."

FIREARM

Ole Horsrud, Fox River Grove, Ill., assignor to Sears, Roebuck and Co., Chicago, ill., a corporation of New York

Application August 7, 1039, Serial No. 288,793

a.;

40

3 Claims. (Cl. 42--12)

This invention relates to firearms and is concerned more particularly with firing mechanism therefor.

Past firearm constructions have been more or less unsatisfactory because of excessive wear between certain parts of the control mechanism, resulting in impairment of accuracy and efficiency carly in the life of the firearm. To overcome this defect and provide a ficearm construction of enhanced reliability and of practically indefinite life is accordingly the essential object of my invention.

Another object is to provide a fire control mechanism in which substantially all of the wear occurs at places not vital to the accuracy and 15 efficiency of the firing mechanism. A further object is to provide a fire control

A further object is to provide a fire control unchanism in which wear at places vital to the efficiency of the mechanism is negligible.

It is a further object of the invention to provide an improved positive locking mechanism for a firearm.

It is another object to provide a firing methanism such that a major part of the strain when the mechanism is cocked is taken by a relatively stationary member or members.

Another object is to provide a sear and striken assembly formed to minimize strain on the sear and sear control mechanism.

It is a further object to provide a firing mecha- 30 nism in which friction between the scar and the striker is practically non-existent.

It is also an object to provide an improved adjustment for the trigger pressure.

A further object is to enable the sear to pass 35 substantially instantaneously from fully obstructing position to fully unobstructing position.

Another object is to provide a striker and bolt construction affording minimum friction therebetween.

It is another object to enable the striker to be in full flight from its rearmost position.

Further objects and advantages of the invention will appear as the description proceeds.

The invention will be better understood upon 45 reference to the foregoing description and the accompanying drawings, in which:

Fig. 1 is a fragmentary longitudinal sectionalview of a firing mechanism embodying features of the invention, with the statker cocked.

Fig. 2 is a fragmentary dievation of a portion of the structure appearing in Fig. 1, but taken from the opposite side.

Fig. 3 is a view similar to Fig. 2 but with a portion removed to disclose certain details.

Fig. 4 is an enlarged sectional view taken substantially as indicated by the line 4—4 in Fbr. 1. Fig. 5 is a view similar to Fig. 1 but with the

parts in the relations assumed when the striker itres the bullet.

Fig. 6 is similar to Fig. 1 but shows a modified drearm construction.

Fig. 7 is similar to Fig. 5 but shows the modified form.

Fig. 8 is a sectional view taken as indicated by the line 6-0 in Fig. 0.

Figs. 9 and 10 are fragmentary elevations showing the firearm unlocked and locked.

Referring now more particularly to the drawings, wherein the same reference characters designate the same parts, a receiver 10 is shown adjacent a barrel 11 adapted to receive a oullet 12 in a shell 13. The receiver carries a bolt 15 provided with the usual hendle 18 by which the told is adapted to be turned and translated in tilbelove 17 of the receiver.

The bolt comprises a forward section 19 haying an elongated narrow recess 20 housing a striker or hammer 21 adapted for limited longitudinal movement in said recess, said striker having a firing pin 22 which at all times is dis-posed in a hole 24 which renders the cap or prime: 25 of the shell accessible to the pin. The striker 21 is of generally flat cross section conforming to the recess 20 and has a slot 27 for the accommodation of thrust bearings 28 and 29 between and about which a firing spring 21 is disposed, the sides of the recess 29 being enlarged as at 32 in Figs. 4 and 8 to accommodate said bearings and spring. A pin 33 mounted on the, bolt 19 serves as a reaction member limiting the bearing 29 rearwardly. The rear end of the slot 20 provides shoulders 35 engagestle with the bearing 29 and a recess 36 providing clearance for the pin 33 and having a wall engageable with the latter, thereby to limit the firing forward stroke of the striker.

In the forth shown in Figs. 1 to 5, the bolt 16 has a rear peripheral shoulder 40 and an exten-45 sion 41 of reduced diameter, said extension being diametrically slotted as at 42 in continuation of the recess 20 in the bolt. Rotatably and sldably fitted about the reduced extension 41 is a coller 45 to which the handle 16 is secured. The 50 colling 45 to which the handle 16 is secured. The and inner sleeves and is preferably slidably engageable with the shoulder 40. A retainer plug 49 releasably threaded at 50 within the rear cond of the reduced portion 41 of the bolt is limited 55 by said portion so that the collar 43 nas sliding 2

engagement with the shoulder 53 on the plug, when file plug is threaded home. A friction spring ring 54 may be provided to take up play. The dollar \$5 may have diametrically opposed slots 56 from which extend helical cam slots 5 \$7 ds/shown in Figs. 1 and 5. The striker 21 has/a/reduced rear extension or neck 59 projectint/rfarwardly into the reduced bolt portion 41 and hisposed in the diametrical slot 42 thereof. abd/terminates rearwardly in cam follower lugs 10 fl adapted to project into the slots 57 of the collar 45. When the striker has fired and is thus in its feremost position, as shown in Fig. 5, the lugs 61 are disposed at the forward ends of the associated cam slots 57 and are so arranged 15 that rotation of the collar 45 in the proper di-rection will cluse the forward walls of the cam slots 37 to force the firing pin 21 rearward against the action of the spring 31. When the handle 16 is pulled and swung from its down position (Fig. 5) to its uppermost position, it rotates the collar 45 to effect a rearward camming of the stuker 2:

The receiver 19 may have a suitable catch (not shown; cooperating with the bolt 15 to prevent rotation of the forward section 19 thereof while permitting the bolt to move axially in the bore 11.

The receiver 10 has a longiture inal channel or keyway \$5 adapted to receive a sear 66 pivold at its forward and as shown at 67 to the forward section 19 of the bolt. The scar ex-tends rearwardly irom the pivot 61 and has an inclined rearwardly facing abutment or shoulder 18 engageable with a forwardly theing abutment or shoulder 11 on the striker 21. These shoulders 35 are adapted to be interengaged when the striker is in its rearmost or cocked position. At such time, the shoulder 70 on the sear 66 is adapted to obstruct the forward movement of the striker 21 and thereby prevent firing. The inclination of the surfaces 1J and 71 is such that, at the moment the sear is released, as will appear, the spring 31 will exert a force which, acting through the shoulder 71 on the striker, will cam the keep downward out of obstructing position and will cause the striker to fire. The inclination of said should as, moreover, is such that, while the sear is supported in obstructing position, substan tially less than the full force of the spring 31 is communicated to the sear pivot pin 67, so 50 handle (C is limited by an abutment (not shown) that said pin is subjected to minimum stress consistent with correct design of the sear supporting mechanism, as will appear.

For controlling the position of the sear 66, 1 provide a bell crank lever dog 15 pivoted as at 65 76 on side plates of a bracket 77 or other suitable means mounted preferably on the receiver 10 as at 78 and elsewhere. The dog 75 has an upwardly extending arm 60 engageable with the bottom side 31 of the sear 86 when the shoulders 10 and 11 are interengaged, and is adapted to be rigidly held there by a latch 83 engaged in the recers 84 in the other arm 85 of the lever. The latch 33 is formed on a trigger \$1 pivotally mounted as at 33 on  $\mu$  depending extension 8365 on the bracket 11, and is urged upward by spring means 91. With the parts thus arranged, it is evident that firing or the striker pin 21 is positively prevented.

The bracket 17 may be U-shaped, providing a 70 bight 35 disposed reaswardly of the dog 15 and having a bearing opening \$6 through which a pin \$7 pivotally connected as at 98 to the arm 85 of the dog 15 is slidably evended. A spring 100 dispesed about the pin "

a shoulder 101 on the pin and with the bight 95 unces the dog to swing clockwise as seen in Figs. 1 and 5, so as to urge the dog arm 80 toward the bottom surface 81 of the scar 99. Compared to the spring 31, the pressure of the spring 100 is very light, so that it offers negligible resistance to the action of the spring 31 in thrusting the sear 56 downward when the latch 33 is released.

When the dog 15 is in locked position, as shown in Fig. 1, its contact point 103 is so disposed as to turn about the pivot IS in response to the downward thrust resulting from the pressure of the spring 31 when the latch 53 is out of the recess £4.

Fig. 5 shows the relation of the parts when the firearm has been fired. To cock the firearm, the handle 15 is turned through a suitable and le in the receiver 10, say about 90°, thereby turning the collar 45 and the forward walls of the cam slots 57 to engage the lugs 61 and cam the 20 striker rearwardly against the resistance of the spring 31. The forward ends of the lugs may be rounded as at 102 to minimize friction. 'The spring 31 at this time is pressing the latch 83 upward, and the spring 100 is urging the bell 25 crank lover arm 80 toward the sear 65 and thus pressing the scar upward into engagement with the striker adjacent the shoulder 11 thereof. As the upward rotation of the handle 15 moves the striker rearward, the spring 109 moves the sear 65 upward to effect engagement between the shoulders 70 and 71, the arm 85 of the dog 75 also moving to bring the recess 84 thereof closer to the end of the latch 83. When the striker is fully withdrawn by the cam action, the spring 160 causes the shoulders 10 and 11 to be fully interengaged and the contact end 103 of the dog 15 to engage the bettom 81 of the scar 66, and enables the spring 91 to slip the latch 83 into the recess 64, all as shown in Fig. 1. At such time, the handle 15 in its upper position, the with forward walls of the cam slots 57 are engaged with the lugs 61 so as to permit the proper positomme of the sear and control mechanism thereis depressed, the scar 63, being locked by the dog 15 and trigger 81 in the position shown in Tig. , positively prevents the striker from movmg forward. The downward movement of the in the receiver 10, and when the handle is brought to rest in its down position, the lags 61 are alined with the slots 55 in the collar 45. so that the forward walls of the cam sicts 57 offer no obstruction to the firing stroke of the firing pin. Now the firearm is fully cocked, and, to fire the same it is necessary merely to pull the trigger \$7.\_\_

The rear part of the keyway 65 is formed to 60 accommodate the sear 66 so that the entire bolt may be removed if desired.

It will be observed that the line of action of the force on the dog 15 in response to the pressure of the spring 31 is adjacent the axis of the pivot bin 75, so that the component in that direction of the force of the shoulder 71 on the shoulder 70 is resisted very largely by the pin 76 and the bracket 77 and accordingly by the ru ceiver 19. Only a relatively small part of the force is taken by the latch \$3 and transmitted thereby to the trigger pivet pin 88. In the move ment of the trigger, there is friction between the latch 83 and the dog 15, and this friction, being relatively light, will not cause appreciable wear ngaged with 75 of the surfaces involved. Also, by virtue of the

2,310,233

fact that the latch 83 is subjected to a relatively light force, the triager pixor pin 88 likewise is subjected to negligible wear. Horeover, even if excessive wear of the frictionally engaged surfaces of the dog 75 and latch 83 or of the trigger (nvc) ifin 58 could take pince, the sear 😂 could he depressed to only a neglicible extent by the sheing 31 during the movement of the latch 83 to a position clear of the dog 15, so that the re-autime wear on the surfaces 18 and 11 would be 10 negigiple. It is thus apparent that the operation of the trigger results in substantially no wear to the surfaces affecting the proper operation of the striker. When the trigger is pulled clear of the dog 75, the passage of the shoulder 71 over 15 the shoulder 10 is practically instantaneous, the sear 56 offering antistantially no resistance to such movement. Consequently, the friction between the surfaces 10 and 11 is practically non-existent and, as a result, the surfaces will remain 20 in their prizinal condition indefinitely, thus insuring the same accurate ficing process throughout the life of the firearm.

The trigger has a bearing surface 110 extending rearwardly and below the bight \$5, and has 25 a recess it recovang the lower end of a spring 112. Received in the upper end of the spring is a projection 114 formed on the bracket bight 95. A serew 117 carried by the triagen is adapted to engage the spring 112 and to adjust the pressure 30 thereof. The spring 112 is relatively light, compared to the spring 31 and accordingly, adjust-ment of the screw 111 will effect slight changes in the spring pressure on the trigger

The bracket 17 may be fasteried at the rear 25 thereof to the receiver 10 in any suitable manner, as by a server 123, and preferably has a slot 121 through which a keeper or laten 122, formed on a safety locking member 123, projects. When the firearm is cocked, as shown in Fig. 1, the 40 lock member may be in inonerative position, as shown in Fig. 1, or it may be slid into operative position as shown by the detect lines in Fig. 1 In this position, the keeper is substantially/er gazed with the bottom side 81 of the sear while 45 the bottom 125 of the locking member is substantially engaged with a shoulder 126 on the trigger. Thus, the locking member positively locks both the sear and the trigger against releasing movement so that it is impossible for the 50 striker 21 to fire.

The locking member 123 preferably has a side plate 130 slidebly engaged with a face 131 on the receiver 10 and has a knurled or otherwise roughoused thumb-engaging projection or handle 55 132 to facilitate movement of the locking mem-The looking member (23 is preferably reber. movably mounted as by screws 135 entending through a plate 136 and through slots 137 formed in the portion 130 of the locking member, and 66 screws being threaded into the receiver 10. The crows and slots determine the limits of movement of the locking member. In one of the limits, the locking member is in inoperative position as shown in Figs. 1, 2 and 3 in full lines, and, in  $_{\rm d5}$ the other limit, the locking member is in operative position, as shown in dotted lines in Fig. 1. The projection 132 is profecably on the side at which the handle 16 is located, for greater convanience. 70

in the operation of rotating the handle 16 to cam the striker rearward, the forward walls of the cam slots 57 exert a rotative force on the striker in the direction of turning of the handle, With the arrangement illustration in Fig. 1, the 75 its full force in driving the striker from its ek-

upper left corner edge of the striker and the lower right corner edge of the striker. If charp, inight score the respective walls (49 and (4) of the recess 20 and would themselves become worn, with the result that the proper dring of the firearm might be senously affected. The fit between the sides of the steiker and the wills (40 and 141 of the recess 20 is preferably such as to sile w substantially no more than free sliding movement of the striker. Since such a fit maures some clearance, it is obvious that if the corner edges referred to were sharp, there may be a biting knife-edge-to-surface friction contact possibly resulting in the deleterious wear above referred to. To obviete such condits, I have rounded said corner edges as shown at 148 and 144, in Fig. 4 thereby providing for engagement between a flat wall and a relatively blunt curved surface as shown, to that friction will be minimized.

The sliding portion 136 of the lock mumber 123 may be formed with openings or indentations 141 and 148, and the cover plate 136 with a opring depression or detent 149 adapted to snap in the recess 148 when the locking member 123 is in inoperative position and in the recess (41 when the locking member is in locked position.

In the form of the invention appearing in Figs. 6 to 10, the striker or hammer 150 has a neck 161 slidably flated in the not 152 in the reduced rear end 163 of the bolt 15. A sloove 185 journaled on said end 163 is slidably engaged with the bolt shoulder 40 and a cap 186 is shreaded in said end. The sleeve has a cam slot 57 cooperative with a lug 167 on the striker neck 161 in the manner set forth above in connection with the lugs 51, so that when the ball handle 15 is raised the wall of said cam slot 67 in Fig. 6, retracts the striker against the resistance of the firing spring 31 to cocked position.

The sear 110 is pivoted to the receiver 15 at 111 sarries a spring 112 forward of the pivot. said shring bearing against the under side of the striker so as to at all times tend to turn the of the sear bas an inclined surface 174 complemental to an inclined surface 145 on the striker. A dox 178 pivoted at 177 to a bracket 178 mountdayat 179 on the receiver is constantly urged in a spring 180 to turn clockwise, an arm ill of the dog being engageable with the rear and 113 of the sear to press the sear surface 174 against the striker surface 115.

A frigger 183 pivoted at 184 to the bracket 118 is urged clockwise by a spring 185 compressed. between the trigger and an shchoring member 105 carried by the bracket and adjustable by hand or a suitable tool. Thus, the other and 191 of the trigger altomutically snaps into curage-ment with the shoulder 188 of the dog 186, as shown in Figs. 5, 9 and 10, upon retraction of the striker as aforesaid.

The safety lock means of Flys. 6 to 10 differs from that previdusly described in that the slide 196 abuts the receiver 10 and not the sear 170. The mechanism is locked when the slide (10) engages the surface [9] of the trigger as shown in full lines in Figs. 6 and 19 and is unlocked when the slide is disposed rearwardly of sold surface as shown in full lines in Figs, 7 and 9 and in clotted lines in Fig. 6.

It is evident from the foregoing that I have provided with a minimum of parts a construption which enables the firing spring 31 to exert

treme rear position to its firing position without interference from the sear \$9 or other means, so that the firing pin has acquired maximum mompulum possible upon its striking the shell cap /25/. The parts are casily accessible, the ds resulting from maintaining the striker strey in docked position are taken largely by the gunframing so as to substantially relieve the trigger.  $\mathfrak{h}\mathfrak{p}\mathfrak{p}$  wear between the surfaces which might seripully affect the efficiency of operation is negligiale. A simple yet effective double acting lock provided, and minute adjustments in the pressure on the trigger are possible. The receiver (0 may be provided with an opening (Figs. 1, 5, 6 and 7) through which a cartridge clip may be 15 fed and used shells released.

4

The elements of the firing and fire control mechanism may be existed or other metal or alloy of sufficient hardness to withstand the conditions of use of the firearm, as is understood by 20 those skilled in the art.

Various gnanges coming within the spirit of the invention may be suggested by those skilled in the art, and hence I do not wish to be limited to the specific forms shown or uses mentioned. I claim

1. In a mechanism for maintaining a firing pin in cocked position, a receiver, a bolt therein, a striker in said bolt and having a forwardly facing shoulder, a sear mounted on said bolt and 30 having a rearwardly facing should r engageable with the aforesaid shoulder when the striker is in cocked position, a lever pivotally supported from said receiver and engaged with said sear, a trigger supported from said receiver and holding said lever in engagement with said sear, and a spring for firing said striker, said spring being inoperative while said trigger holds said lever engaged with said sear, said trigger being disengageable from said lever to render said firing 40

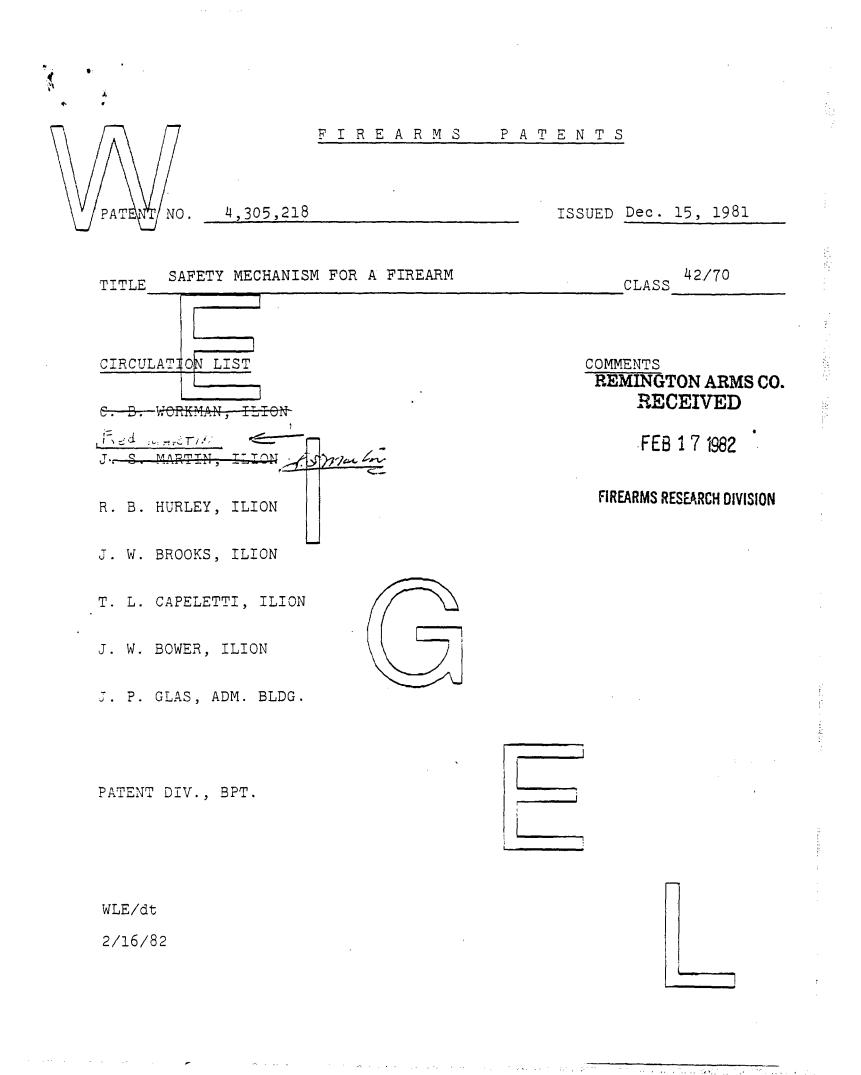

spring operative, at least one of said shoulders being inclined upwardly and forwardly to enable said striker to cam said shoulders apart when said spring becomes operative.

2. A fircarm comprising a bolt, a striker therein, a sear movable into and out of a position obsteucting firing movement of said striker, said sear being movable by said striker out of cbstructing position, means pivotally mounting said sear on said bolt, suid means being disposed in advance of the place of engagement, releasable means for maintaining said sear in obstruct. ing position, said sear extending longitudinally between the place of engagement and its pivot, so that the forward component of the force of the spring is withstood by said bolt, the releasable means comprising a member engaging said sear opposite the place of interengagement between said striker and sear to preclude bending of said sear by said striker.

3. A firearm, comprising a receiver, a bolt therein, a striker in said bolt, a sear pivoted or. said bolt and movable into and out of a position obstructing firing movement of said striker, a 25 spring for propelling said striker, said sear being movable by said striker out of obstructing position, means including a lever pivoted on said vectiver for maintaining said scar in obstructing positon, the sear pivot being disposed to transmit the forward component of the force of the spring-pressed striker on said sear to said bolt. said lever engaging said sear at such a point, that when the sear is swung out of obstructing position, it will swing the lever, and means releasably retaining said lever in position to maintain the sear in obstructing relation to the striker, the lever pivot being disposed to with. stand a major portion of the downward componert of said striker on said sear.

#### ABSTRACT

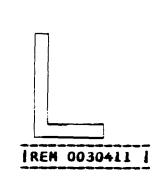

[57]

A safety device for a bolt action firearm has a laterally extending lock pin which is movable laterally to engage a recess in the cocking lug of the striker to prevent the striker from moving forward despite sear release by the trigger mechanism. An operating lever is movable rearward from a forward position in which the firearm may be discharged, rotating a helical cam which moves the lock pin laterally into the recess in the cocking lug. When the lever is moved further rearward, a cam on the operating lever pivots a blade upward into a groove in the bolt to prevent rotation of the bolt.

## SAFETY MECHANISM FOR A FIREARM

#### BACKGROUND OF THE INVENTION

1

The present invention relates to improvements in <sup>5</sup> firearms and particularly to an improved safety mechanism for bolt action firearms.

A long-standing problem in bolt action firearms is that when the bolt is rotated to the unlocked position in opening the breech, the firearm may accidentally dis- 10 charge a cartridge contained in its chamber. This occurs because many safety mechanisms for bolt action firearms must be placed in an "off-safe," or firing, position to permit the bolt to be raised from its closed and locked 15 position.

Particularly when firearms have been designed or nodified for hunting use, the trigger mechanism is often adjusted to require only a very small amount of movement to release the striker which propels the firing pin into the primer of the cartridge. While in most military 20 rifles an appreciable amount of slack in the trigger mechanism must be taken up before the striker is released, such firearms when modified for hunting use ordinarily do not have such slack in the trigger mechanism, and are subject to accidental discharge as a result. 25

Some bolt action firearms employ a safety mechanism attached to the rear end of the breech bolt. Typically, a knob or small lever of such a safety mechanism must be moved to engage or disengage the safety, a movement requiring the shooter to release his grip on the stock of <sup>30</sup> the firearm.

Most previously known safety mechanisms for bolt action firearms are either of the bolt mounted type just described, or else operate by blocking a portion of the trigger or sear mechanism, preventing the trigger from 35 being moved sufficiently for the sear to release the striker. Because of the short distance which the trigger must move to discharge a cartridge in a firearm designed for hunting use, however, even a small amount of wear in a safety mechanism of this type may be suffi- 40 cient to allow an accidental discharge of the fitearm, upon rotation of the bolt to open the breech, or should the trigger snap on an object as the firearm is being carried.

Customarily, in the case of known firearms which are 45 provided with a lock for securing the bolt against rota-tion, the bolt lock is coupled with the safety mechanism in such a way that when the safety mechanism is set on "safe," the bolt is prevented from opening. In such firearms, then, the bolt and firing mechanism are both 50 locked or else both capable of actuation. As a result, there is a definite uncertainty while handling the firearm, because a shot can be accidentally discharged as the bolt is rotated.

a bolt action firearm which can secure the bolt in its locked position, preventing opening of the bolt and also preventing actuation of the firearm, and which selectively permits rotation of the bolt from its locked position while still preventing discharge of a cartridge. 60 Additionally, such a safety mechanism should be handily operable by the shooter without the need to remove his hand from its normal position on the stock of the firearm

### SUMMARY OF THE INVENTION

The present invention overcomes the aforementioned shortcomings and disadvantages of previously known safety mechanisms by providing a three-position safety mechanism mounted on the tang of the receiver of the bolt action firearm, where it is thumb-operable. In one "safe" position the safety mechanism of the present invention prevents discharge of the firearm and also prevents rotation of the bolt, while in another "safe" position it prevents discharge of the firearm, yet allows rotation of the bolt from its closed-and-locked position to a position in which the safety mechanism of the firearm prevents the firearm from discharging the cartridge. In a third, or "off-safe" position the safety mechanism permits discharge of the weapon.

It is therefore a primary objective of the present invention to provide an improved safety mechanism for use in bolt action firearms.

It is another important objective of the present invention to provide a safety mechanism for bolt action firearms which cannot be overcome by pulling the trigger of such firearm.

It is yet another important objective of the present invention to provide a safety mechanism which prevents discharge of the firearm independently of the trigger and sear mechanism.

It is yet a further objective of the present invention to provide a safety mechanism which prevents inadvertent rotation of the breech bolt of a bolt action firearm.

It is a still further objective of the present invention to provide a safety mechanism which is operable without the need for the shooter to move his hand from its normal position gripping the stock of the firearm.

The present invention provides a thumb-operated three-position safety mechanism which is located conveniently on the tang of the receiver portion of the firearm. It is applicable to nearly any bolt action firearm having a striker located at the rear of the bolt, and having a cocking lug for engaging the sear mechanism on the bottom of the striker.

The safety mechanism of the invention comprises a lock pin which extends laterally toward the striker through a bore provided in the tang of the receiver, and which is laterally movable by action of a cam to engage and hold the striker, preventing discharge of the firearm. Another cam is used to move a blade into a groove in the breech bolt of the firearm to secure the bolt in a closed position.

In a preferred embodiment, one end of the lock pin fits into an opening in a safety mechanism operating lever which extends upward from the tang of the receiver to a position where a shooter can easily move the lever with his thumb. Movement of the lever forward or, rearward rotates the lock pin, and a helical cam groove included in the lock pin moves it laterally of the firearm as it is rotated. When the firearm is cocked, the What is needed, therefore, is a safety mechanism for 55 lock pin can be moved in this manner into a recess which is provided in the cocking lug. As the lock pin extends into the recess in the cocking lug, it engages a conical inner surface of the recess in the cocking lug, forcing the cocking lug, and thereby also the striker, to move a slight distance rearward within the receiver With the lock pin engaged in the recess in the cocking lug, the sear lever is free to move away from and to return to its position locking the cocking lug, allowing operation of the trigger mechanism while the safety mechanism is in one of the two "safe" positions. The 65 lock pin of the safety mechanism of the present invention thus holds the striker securely in a rearward position independently of the trigger mechanism, prevent-

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON**

3

ing discharge of the firearm despite operation of the trigger mechanism and despite jarring which might otherwise cause an accidental discharge.

Further movement of the operating lever of the safety mechanism, in the direction required to engage 5 the lock pin in the recess of the cocking lug, moves a cam attached to the operating lever into contact with a follower located on one end of a blade which is pivotably mounted on the receiver of the firearm. The cam pivots the blade about an axis generally perpendicular 10 to the blade, raising an edge of the blade through a slot provided in the receiver of the firearm into a groove provided in the bolt of the firearm, thereby preventing the bolt from rotating away from its closed-and-locked position closing the breech. 15

It is, therefore, a principal feature of the invention that it includes a laterally-extending lock pin which is movable laterally into locking engagement in a recess provided in a part of the striker of a bolt action firearm, to positively engage and retain the striker, preventing 20 discharge of the firearm.

It is another important feature of safety mechanism of the present invention that the lock pin positively moves the striker rearward in the receiver of the firearm as the lock pin moves into the recess provided in the cocking 25 lug.

It is another important feature of the present invention that when the operating lever of the safety mechanism is in an intermediate position, the bolt may be rotated, but the cocking lug is held securely, preventing 30 discharge of the firearm.

It is a primary advantage of the present invention that it provides greater safety then previously known safety mechanisms for bolt action firearms, since it locks the striker independently of the trigger mechanism of the 35 firearm.

It is another primary advantage of the present invention that it is more convenient to operate than a boltmounted safety mechanism.

It is a further advantage of the present invention that a it is less susceptible to wear than safety mechanisms which depend upon lockage of the trigger mechanism, particularly in firearms requiring only a slight movement of the trigger to discharge the firearm.

The foregoing and other objectives, features and 45 advantages of the present invention will be more readily understood upon consideration of the following detailed description of the invention taken in conjunction with the accompanying drawings.

#### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a fragmentary partially cut away side elevational view of a rifle including an exemplary safety mechanism embodying the present invention.

FIG. 2 is a top view of the rear portion of the receiver 55 of the rifle shown in FIG. 1, with the bolt removed.

FIG. 3 is a partially sectional side elevational view of a portion of the bolt of the rifle shown in FIG. 1, showing the lock pin and the blade of the safety mechanism shown in FIG. 1 engaged therein.

FIG. 4 is a bottom view, taken along line 4-4 of FIG. 3, of a portion of the bolt shown in FIG. 3, with the lock pin of the safety mechanism of the invention engaged therein.

FIG. 5 is a pictorial view, at an enlarged scale, of the 65 lock pin of the safety mechanism shown in FIG. 1.

FIG. 6 is a bottom view, at an enlarged scale, of a detail of the bolt of the rifle shown in FIG. 1, showing

the relationship between the lock pin of the safety mechanism and the cocking lug of the bolt.

FIG. 7 is a right side elevational view, at an enlarged scale, of the safety mechanism shown in FIG. 1.

FIG. 8 is a bottom view of the safety mechanism shown in FIG. 1, taken along line 8-8 of FIG. 7.

FIG. 9 is a left side elevational view of the safety mechanism shown in FIG. 1, taken along line 9-9 of FIG. 8.

#### DETAILED DESCRIPTION OF THE INVENTION

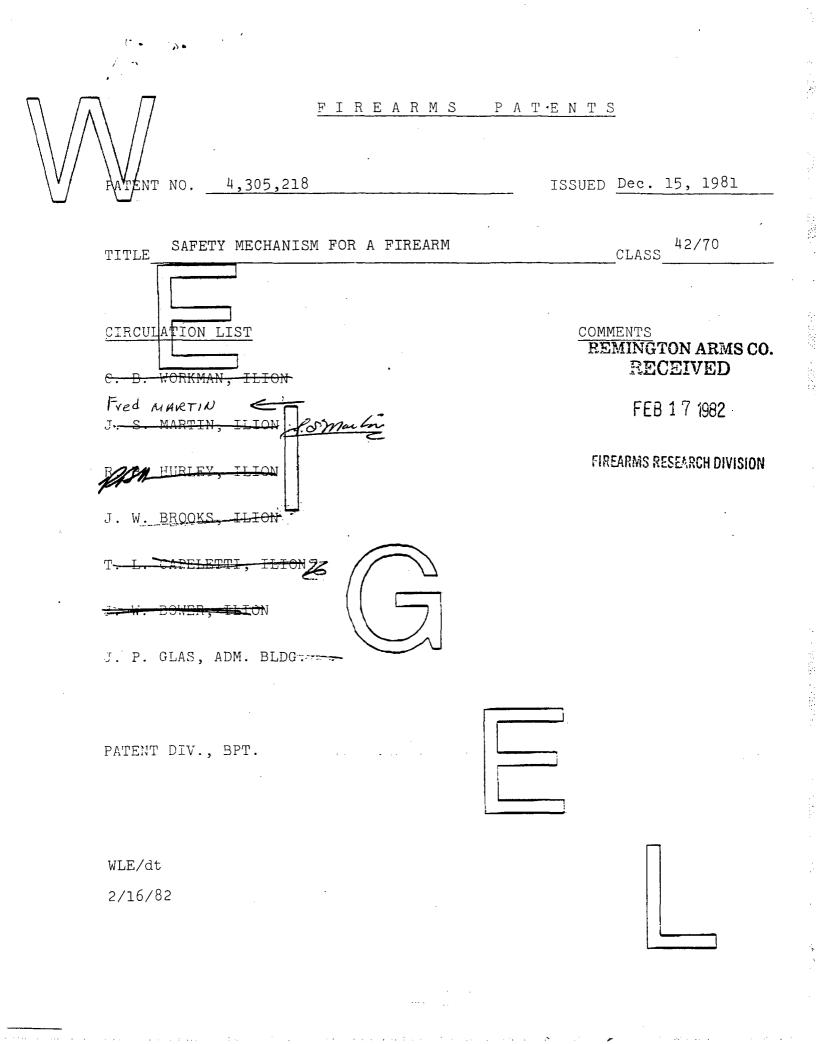

A bolt action rifle 10, equipped with a safety mechanism 12 which is a preferred embodiment of the present 15 invention, is shown in FIG. 1. The rifle 10 comprises a receiver 14 having a barrel 15 attached at its forward end. A breech bolt 16 is operatively mounted in the receiver 14 to block the breech of the barrel 15. A bolt handle 18 of the breech bolt 16 is shown (partially cut 20 away for clarity) in a forward-and-down, closed-andlocked position, and a striker 20 carried by the bolt 16, is in its cocked position, in which it is held rearward with respect to the bolt 16 against the force of a striker spring (not shown).

The trigger mechanism of the rifle comprises a trigger 22, pivotably mounted on a trigger pivot pin 24, and a sear lever 26 mounted on a sear pivot pin 28. A forward end of the trigger 22 is supported by a trigger adjusting screw 30 and a trigger spring 32, while a sear 34 is provided on an upper portion of the trigger 22 to releasably hold the sear lever 26 in a position interfering with the forward movement of the striker 20 when the firearm is cocked.

Referring now also to FIGS. 2-5, the safety mechanism of the present invention may be seen to comprise a backing piece 36 fitted against one side of the tang 38 of the receiver 14 of the rifle 10, and a lock pin 40, having a longitudinal axis 42, which extends laterally through a bore 43 defined in the backing piece 36 and the tang 38 of the receiver 14. An operating lever extends upward above the backing piece 38 and has a head 45 shaped to be conveniently moved by thumb pressure. An elongated opening 46, through which an outer end portion 47 of the lock pin 40 extends, is defined in the operating lever 44. A cover plate 48 is secured to the backing piece to limit movement of the operating lever 44, while a hole 50 defined in the cover plate 48 and located in alignment with the elongated opening 46 permits the lock pin 40 to move laterally and also permits observa-50 tion of the position of the lock pin 40. The operating lever 44 may be moved forward, rotating about a pivot axis coincident with the central longitudinal axis 42 of the lock pin 40, from the position shown in solid line in FIG. 1, in which the safety mechanism of the invention is in a "safe" position, to the "off-safe" position shown in broken line, which permits the rifle 10 to be discharged.

A cam 52, is located on the lower portion of the operating lever 44, where it engages a follower 54 con-60 nected to a blade 56. The blade 56 is pivotably secured to the receiver 14 by, for example, a blade mounting screw 57 extending laterally through the blade into the receiver 14. An edge 58 of the blade 56 extends upward through a slot 60 in the receiver, engaging a groove 62 defined in the bottom of the bolt 16, near the bolt handle 18, preventing the bolt 16 from rotating out of its forward-and-down locked position. A blade spring 64 uormally retains the edge 58 in a lowered position,

## ABSTRACT

A safety device for a bolt action firearm has a laterally extending lock pin which is movable laterally to engage a recess in the cocking lug of the striker to prevent the striker from moving forward despite sear release by the trigger mechanism. An operating lever is movable rearward from a forward position in which the firearm may be discharged, rotating a helical cam which moves the lock pin laterally into the recess in the cocking lug. When the lever is moved further rearward, a cam on the operating lever pivots a blade upward into a groove in the bolt to prevent rotation of the bolt.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

### SAFETY MECHANISM FOR A FIREARM

1

#### BACKGROUND OF THE INVENTION

The present invention relates to improvements in firearms and particularly to an improved safety mechanism for bolt action firearms.

A long-standing problem in bolt action firearms is that when the bolt is rotated to the unlocked position in opening the breech, the firearm may accidentally discharge a cartridge contained in its chamber. This occurs because many safety mechanisms for bolt action firearms must be placed in an "off-safe," or firing, position to permit the bolt to be raised from its closed and locked position. 15

Particularly when firearms have been designed or modified for hunting use, the trigger mechanism is often adjusted to require only a very small amount of movement to release the striker which propels the firing pin into the primer of the cartridge. While in most military <sup>20</sup> rifles an appreciable amount of slack in the trigger mechanism must be taken up before the striker is released, such firearms when modified for hunting use ordinarily do not have such slack in the trigger mechanism, and are subject to accidental discharge as a result. <sup>25</sup> Some bolt action firearms employ a safety mechanism

attached to the rear end of the breech bolt. Typically, a knob or small lever of such a safety mechanism must be moved to engage or disengage the safety, a movement requiring the shooter to release his grip on the stock of 30 the firearm.

Most previously known safety mechanisms for bolt action firearms are either of the bolt mounted type just described, or else operate by blocking a portion of the trigger or sear mechanism preventing the trigger from 35 being moved sufficiently for the sear to release the striker. Because of the short distance which the trigger must move to discharge a cartridge in a firearm designed for hunting use, however, even a small amount of wear in a safety mechanism of this type may be suffi-0 cient to allow an accidental discharge of the firearm, upon rotation of the bolt to open the orgech, or should the trigger snap on an object as the firearm is being carried.

Customarily, in the case of known firearms which are 45 provided with a lock for securing the bolt against rotation, the bolt lock is coupled with the safety mechanism in such a way that when the safety mechanism is set on "safe," the bolt is prevented from opening. In such firearms, then, the bolt and firing mechanism are both 50 locked or else both capable of actuation. As a result, there is a definite uncertainty while handling the firearm, because a shot can be accidentally discharged as the bolt is rotated.

What is needed, therefore, is a safety mechanism for 55 a bolt action firearm which can secure the bolt in its locked position, preventing opening of the bolt and also preventing actuation of the firearm, and which selectively permits rotation of the bolt from its locked position while still preventing discharge of a cartridge. 60 Additionally, such a safety mechanism should be handily operable by the shooter without the need to remove his hand from its normal position on the stock of the firearm.

#### SUMMARY OF THE INVENTION

The present invention overcomes the aforementioned shortcomings and disadvantages of previously known

65

safety mechanisms by providing a three-position safety mechanism mounted on the tang of the receiver of the bolt action firearm, where it is thumb-operable. In one "safe" position the safety mechanism of the present invention prevents discharge of the firearm and also prevents rotation of the bolt, while in another "safe" position it prevents discharge of the firearm, yet allows rotation of the bolt from its closed-and-locked position to a position in which the safety mechanism of the firearm prevents the firearm from discharging the cartridge. In a third, or "off-safe" position the safety mechanism permits discharge of the weapon.

It is therefore a primary objective of the present invention to provide an improved safety mechanism for use in bolt action firearms.

It is another important objective of the present invention to provide a safety mechanism for bolt action firearms which cannot be overcome by pulling the trigger of such firearm.

It is yet another important objective of the present invention to provide a safety mechanism which prevents discharge of the firearm independently of the trigger and sear mechanism.

It is yet a further objective of the present invention to provide a safety mechanism which prevents inadvertent rotation of the breech bolt of a bolt action firearm.

It is a still further objective of the present invention to provide a safety mechanism which is operable without the need for the shooter to move his hand from its normal position gripping the stock of the firearm.

The present invention provides a thumb-operated three-position safety mechanism which is located conveniently on the tang of the receiver portion of the firearm. It is applicable to nearly any bolt action firearm having a striker located at the rear of the bolt, and having a cocking lug for engaging the sear mechanism on the bottom of the striker.

The safety mechanism of the invention comprises a lock pin which extends laterally toward the striker through a bore provided in the tang of the receiver, and which is laterally movable by action of a cam to engage and hold the striker, preventing discharge of the firearm. Another cam is used to move a blade into a groove in the breech bolt of the firearm to secure the bolt in a closed position.

In a preferred embodiment, one end of the lock pin fits into an opening in a safety mechanism operating lever which extends upward from the tang of the receiver to a position where a shooter can easily move the lever with his thumb. Movement of the lever forward or rearward rotates the lock pin, and a helical cam groove included in the lock pin moves it laterally of the firearm as it is rotated. When the firearm is cocked, the lock pin can be moved in this manner into a recess which is provided in the cocking lug. As the lock pin extends into the recess in the cocking lug, it engages a conical inner surface of the recess in the cocking lug, forcing the cocking lug, and thereby also the striker, to move a slight distance rearward within the receiver With the lock pin engaged in the recess in the cocking lug, the sear lever is free to move away from and to return to its position locking the cocking lug, allowing operation of the trigger mechanism while the safety mechanism is in one of the two "safe" positions. The lock pin of the safety mechanism of the present invention thus holds the striker securely in a rearward position independently of the trigger mechanism, prevent-

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

ing discharge of the firearm despite operation of the trigger mechanism and despite jarring which might otherwise cause an accidental discharge.

Further movement of the operating lever of the safety mechanism, in the direction required to engage 5 the lock pin in the recess of the cocking lug, moves a cam attached to the operating lever into contact with a follower located on one end of a blade which is pivotably mounted on the receiver of the firearm. The cam pivots the blade about an axis generally perpendicular 10 to the blade, raising an edge of the blade through a slot provided in the receiver of the firearm into a groove provided in the bolt of the firearm, thereby preventing the bolt from rotating away from its closed-and-locked position closing the breech. 15

It is, therefore, a principal feature of the invention that it includes a laterally-extending lock pin which is movable laterally into locking engagement in a recess provided in a part of the striker of a bolt action firearm, to positively engage and retain the striker, preventing 20 discharge of the firearm.

It is another important feature of safety mechanism of the present invention that the lock pin positively moves the striker rearward in the receiver of the firearm as the lock pin moves into the recess provided in the cocking 25 lug.

It is another important feature of the present invention that when the operating lever of the safety mechanism is in an intermediate position, the bolt may be rotated, but the cocking lug is held securely, preventing 30 discharge of the firearm.

It is a primary advantage of the present invention that it provides greater safety then previously known safety mechanisms for bolt action firearms, since it locks the striker independently of the trigger mechanism of the 35 firearm.

It is another primary advantage of the present invention that it is more convenient to operate than a boltmounted safety mechanism.

It is a further advantage of the present invention that 40 it is less susceptible to wear than safety mechanisms which depend upon lockage of the trigger mechanism, particularly in firearms requiring only a slight movement of the trigger to discharge the firearm.

The foregoing and other objectives, features and 45 advantages of the present invention will be more readily understood upon consideration of the following detailed description of the invention taken in conjunction with the accompanying drawings.

#### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a fragmentary partially cut away side elevational view of a rifle including an exemplary safety mechanism embodying the present invention.

FIG. 2 is a top view of the rear portion of the receiver 55 of the rifle shown in FIG. 1, with the bolt removed.

FIG. 3 is a partially sectional side elevational view of a portion of the bolt of the rifle shown in FIG. 1, showing the lock pin and the blade of the safety mechanism shown in FIG. 1 engaged therein.

FIG. 4 is a bottom view, taken along line 4-4 of FIG. 3, of a portion of the bolt shown in FIG. 3, with the lock pin of the safety mechanism of the invention engaged therein.

FIG. 5 is a pictorial view, at an enlarged scale, of the 65 lock pin of the safety mechanism shown in FIG. 1.

FIG. 6 is a bottom view, at an enlarged scale, of a detail of the bolt of the rifle shown in FIG. 1, showing

4

the relationship between the lock pin of the safety mechanism and the cocking lug of the bolt.

FIG. 7 is a right side elevational view, at an enlarged scale, of the safety mechanism shown in FIG. 1.

FIG. 8 is a bottom view of the safety mechanism shown in FIG. 1, taken along line 8-8 of FIG. 7.

FIG. 9 is a left side elevational view of the safety mechanism shown in FIG. 1, taken along line 9-9 of FIG. 8.

#### DETAILED DESCRIPTION OF THE INVENTION

A bolt action rifle 10, equipped with a safety mechanism 12 which is a preferred embodiment of the present 15 invention, is shown in FIG. 1. The rifle 10 comprises a receiver 14 having a barrel 15 attached at its forward end. A breech bolt 16 is operatively mounted in the receiver 14 to block the breech of the barrel 15. A bolt handle 18 of the breech bolt 16 is shown (partially cut 20 away for clarity) in a forward-and-down, closed-andlocked position, and a striker 20 carried by the bolt 16, is in its cocked position, in which it is held rearward with respect to the bolt 16 against the force of a striker spring (not shown).

The trigger mechanism of the rifle comprises a trigger 22, pivotably mounted on a trigger pivot pin 24, and a sear lever 26 mounted on a sear pivot pin 28. A forward end of the trigger 22 is supported by a trigger adjusting screw 30 and a trigger spring 32, while a sear 34 is provided on an upper portion of the trigger 22 to releasably hold the sear lever 26 in a position interfering with the forward movement of the striker 20 when the firearm is cocked.

Referring now also to FIGS. 2-5, the safety mechanism of the present invention may be seen to comprise a backing piece 36 fitted against one side of the tang 38 of the receiver 14 of the rifle 10, and a lock pin 40, having a longitudinal axis 42, which extends laterally through a bore 43 defined in the backing piece 36 and the tang 38 of the receiver 14. An operating lever extends upward above the backing piece 38 and has a head 45 shaped to be conveniently moved by thumb pressure. An elongated opening 46, through which an outer end portion 47 of the lock pin 40 extends, is defined in the operating lever 44. A cover plate 48 is secured to the backing piece to limit movement of the operating lever 44, while a hole 50 defined in the cover plate 48 and located in alignment with the elongated opening 46 permits the lock pin 40 to move laterally and also permits observa-50 tion of the position of the lock pin 40. The operating lever 44 may be moved forward, rotating about a pivot axis coincident with the central longitudinal axis 42 of the lock pin 40, from the position shown in solid line in FIG. 1, in which the safety mechanism of the invention is in a "safe" position, to the "off-safe" position shown in broken line, which permits the rifle 10 to be discharged.

A cam 52, is located on the lower portion of the operating lever 44, where it engages a follower 54 con-60 nected to a blade 56. The blade 56 is pivotably secured to the receiver 14 by, for example, a blade mounting screw 57 extending laterally through the blade into the receiver 14. An edge 58 of the blade 56 extends upward through a slot 60 in the receiver, engaging a groove 62 65 defined in the bottom of the bolt 16, near the bolt handle 18, preventing the bolt 16 from rotating out of its for ward-and-down locked position. A blade spring 64 normally retains the edge 58 in a lowered position,

### THE SAFETY SWITCH

- The safety switch provides protection against acdidental or unintentional discharge under normal usage when properly engaged.
- To engage the safety switch, put the switch in the "S position. See picture 3.

Always put the safety switch in the "S" position before handling, loading or unloading the firearm.

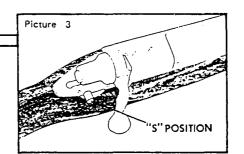

- When you are ready to fire the firearm, put the safety switch in the "F" position. See picture 4.
- Do not touch the trigger while moving the safety switch.

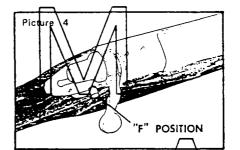

Never pull the trigger when the safety switch is in the "S" position.

WARNING: The firearm will fire when the trigger Is pulled and the safety switch is in the "F" position.

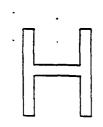

Even when the safety switch is in the "S" position, careless handling can cause the firearm to tire.

Δ

10.00

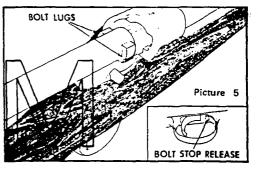

The bolt assembly locks the cartridge into the chamber.

#### TO INSTALL THE BOLT ASSEMBLY:

- Point the firearm in a safe direction.
   Put the safety switch in the "S" position.
   Align the lugs on the bolt assembly with the receiver. See picture 5.
- 4. Slide the bolt assembly into the receiver and push all the way in. To lock the bolt assembly into position push the
- 5. bolt handle down.

## TO REMOVE THE BOLT ASSEMBLY:

- Point the firearm in a safe direction.
   Put the safety switch in the "S" position.
   Do not touch the trigger while moving the safety switch.
- Raise the bolt handle.
   Pull the bolt handle all the way back.
- 6. Push the bolt stop release. See picture 5.
- As you push the bolt stop release, slide the bolt from the firearm. 7.

• •

 $(M, j, M) \geq 0$ 

1. No. 1

The Principal of the

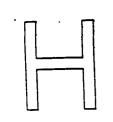

THE TRIGGER ASSEMBLY

Pulling the trigger fires the fifear The trigger is adjusted at the actory All adjustments to the trigger mass be made by the factory of a REM-INGTON RECOMMENDED GUN SMITH.

Never remove the trigger mechanism, or make adjustments to the trigger or trigger assembly.

NEVER put your finger on the trigge unless you are going to fire the fire

## THE BARREL

ì

#### The inside of the barrel must citian and free of obstructions.

- TO CHECK THE INSIDE OF THE BARREL: ١.
- Point the firearm in a safe direction. 1.
- Put the safety switch in the "S" position. Raise the bolt handle. 2
- 3.
- Pull the bolt handle all the way back. 4
- 5. Remove any ammunition from the chamber or magazine. See page 8.

e chamber

BARREI

- 6.
- 7.
- Remove the bolt. See page 5. Look through the inside of the barrel from end to the muzzle. See picture 1.

#### TO REMOVE OBJECT FROM INSIDE THE 11

- Use the correct size cleaning rod. 1.
- Ose the correct size cleaning rod.
   Push the cleaning rod from the chamber end all theway through the barrel, until the rod comes out the muzzle.
   If an object cannot be easily pushed out of the barrel with a cleaning rod, return the firearm to the factory or a REMINGTON RECOMMENDED GUNSMITH.

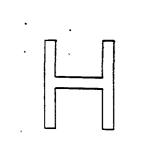

- NEVER try to remove an object from the barrel by loading another cartridge and flring.
- ш TO CLEAN THE BARREL FOLLOW INSTRUCTIONS SHOWN ON PAGE 11.

Before loading the firearm make sure the inside of the barrel is free of dirt, or other objects.

42

#### TO LOAD THE FIREARM

- ſ TO LOAD THE MAGAZINE AND CHAMBER:
- Point the firearm in a safe direction.
   Put the safety switch in the "S" position.
   Raise the bolt handle.

- 4. Pull the bolt handle all the way back. Push four cartridges of the correct caliber, one at a time, into the magazine. If the firearm is a a time, into the inigazine. In the interm is a magnum, you can only load three cartridges. If the firearm is a 17, 222, or 223 caliber, the magazine will hold 5 cartridges. Keep the bullets aligned toward the chamber. See Picture 6.
  6. Put one cartridge into the chamber.
- Due your fingers to push the chamber.
   Use your fingers to push the cartridges in the magazine all the way down. Slowly slide the bolt assembly forward, so that the bolt slides over the top of the cartridges in the magazine.
   Push the bolt handle down.

#### THE FIREARM IS NOW LOADED.

To fire the firearm, put the safety switch in the "F" position.

THE FIREARM IS READY TO FIRE.

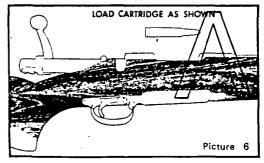

- 11 TO LOAD ONE CARTRIDGE ONLY:
- 1. Point the firearm in a safe direction.
- Put the safety switch in the "S" position.
- Put the safety switch it
   Raise the bolt handle.

7

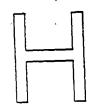

- Pull the bolt handle all the way back. Put one cartridge of the correct caliber on the magazine follower, or in the chamber. See 5. picture 6.
- Slide the bolt handle forward, then push the bolt 6. handle down to lock the cartridge into the chamb

WARNING: Always check the cartridge for the correct caliber before loading the firearm.

## **CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON**

There are two types of Model 700 rifles, one with a FLOOR PLATE and one without a FLOOR PLATE. INSTRUCTIONS FOR THE MODELS WITH A FLOOR PLATE

- 1. Point the muzzle in a safe direction.
- Put the safety switch in the "S" position. 2.
- 3 Raise the bolt handle.
- Put one hand over the top of the ejection port. 4. Slowly pull the bolt handle back with your other 5.
- hand to remove the cartridge from the chamber. 6. Hold the cartridge and remove it from the firearm.
- Put your hand under the floor plate.
- Push the floor plate latch to release the floor plate. 8. See picture 7. The magazine spring and follower will be released
- from the magazine.
- Remove released cartridnes. 9.
- 10. Push in the magazine tollower, then close the floor plate.

WARNING: Make sure there are no cartridges in the chamber or mayazine.

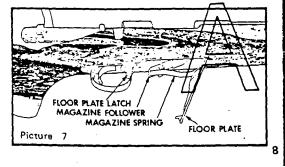

INSTRUCTIONS FOR THE MODELS WITHOUT A FLOOR PLATE

- 1. Point the muzzle in a safe direction.
- Put the safety switch in the "S" position.
- 3.
- Raise the bolt handle. Put one hand over the top of the ejection port. 4.
- Slowly pull the bolt handle back with your other 5. hand to remove the cartridge from the chamber.
- 6. Hold the cartridge and remove it from the firearm.

- Keep the muzzle pointed up, push the bolt handle 7. slowly forward until the cartridge is released from the magazine. CAUTION: The cartridge may slide into the chamber, if the bolt is pushed too far forward. See note below.
- Pull the bolt handle fully back and remove the 8. cartridge from the ejection port.
- 9. Repeat this action until the magazine is empty.

WARNING: Chack the chamber and the magazine to make sure th era are no cartridges in the firearm.

NOTE: If the polt is pushed all the way forward, and a cartridge slides into the chamber, the gun can be fired. Normally, the cartridges/will slide out of the chamber when the bolt is pulled back. If the cartridge remains in the chamber, polite the rhorzie in a safe direction, slide the bolt forward all the way and push the bolt handle down to lock the bolt. Then repeat steps 2 through 9 above.

R2539668

. . . . . .

TO ASSEMBLE THE SLING STRAP

See picture 9 for the location of parts: 1. Slide the strap through the band.

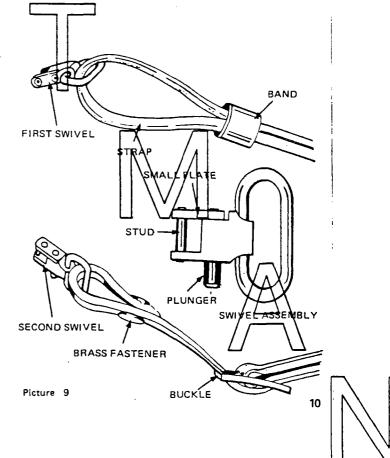

- Slide the strap through the band.
   Push the strap up through the first swivel.
- 3. Slide the strap back through the band.
- Push the strap into and through the buckle.
   Push the strap down and through the second
- swivel. 6. Align the slots in the strap and fasten with the brass fastener.

TO ATTACH THE SLING STRAP ASSEMBLY TO THE STOCK.

See picture 9 for location of parts:

- 7. Push plunger on swivel until the small plate lifts and is free of the stud.
- Push the stud into the center of the swivel screw.
   Close the plate on the swivel to lock the swivel to the swivel screw.
- to the swivel screw. 10. To adjust the length of the strap, pull the strap through the buckle.

TO REMOVE THE SLING FROM THE STOCK To remove the sling strap assembly from the stock repeat step 7.

÷,

#### LUBRICATION AND MAINTENANCE

Over-lubrication should be avoided at all times. A thin coat of Rem<sup>tm</sup> Oil is all that is needed to prevent the possibility of rusting. See note below.

When the firearm is to be stored, it should be carefully cleaned and thoroughly oiled. Outside surfaces should be wiped with a light coat of Rem<sup>tm</sup> Oil occasionally.

LUBRICATION:

When firearm is to be reused, all excess lubrication must be removed. The chamber and bore must be thoroughly wiped dry.

NOTE: Remington Rem<sup>tm</sup> Oil with DuPont Teflon Wet Lubricant is available from your local dealer. If your dealer is out of stock, ask him to order Rem<sup>tm</sup> Oil from his Remington distributor.

#### TO CLEAN THE BARREL

11

WARNING: Check the chamber and magazine to make sure there are no cartridges in the firearm.

- 1. Use the equipment provided in a good cleaning  $ki\tau, \label{eq:kit}$
- 2. Remove the bolt assembly. See instructions on Page 5.

3. Select the correct caliber cleaning brush and attach

the brush to the cleaning rod. 4. Put the cleaning brush into the gun cleaning solvent.

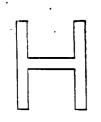

NOTE: Barrel should lay horizontally with the ejection port facing down during cleaning. Always clean the barrel from the chamber end to the muzzle.

- 5. Push the cleaning brush through the barrel several times.
- Remove brush from rod attach tip with patch, and push through the voge.
   Repeat several times, using a new cleaning patch
- each time, until the patch is not dirty. 8. Push a clean patch saturated with Rem<sup>tm</sup> Oll
- through the barrel. 9. Push a clean dry patch through the barrel to
- remove excess lubricant. 10. Apply a thin coat of Rem<sup>tm</sup> Oil to the **qutside**
- of the barrel with a soft clean cloth.
- 11. After cleaning the barrel, clean the receiver an the trigger assembly.

WARNING: This firearm should be checked period ically by the Remington Arms Company. Inc. or a REMINGTON RECOMMENDED GUNSMITH. This will insure proper inspection and any necessary replacement of worn or damaged parts.

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

10100 D.1-1

# TO CLEAN THE RECEIVER AND TRIGGER ASSEMBLY

## TO CLEAN THE RECEIVER AND TRIGGER ASSEMBLY

- 1. Put safety switch to "S" position.
- 2. Remove the bolt assembly. See Instructions on Page 5.
- 3. Turn the rifle upside down.
- 4. Remove the screws from the trigger guard. See Picture 10.
- 5. Lift the stock away from the receiver and trigger associated

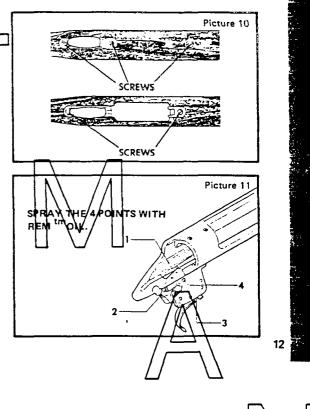

MODELS WITHOUT A FLOOR PLATE:

Remove the magazine spring and follower from the receiver.

NOTE: Clean the receiver and trigger assembly as a unit with  $\operatorname{Rem}^{tm}$  Oil.

Spray the receiver and the four points of the trigger assembly with Rem<sup>tm</sup> Oil (see Picture 11). Let stand for 15 minutes. Spray again to wash off components. Shake off excess lubricant.

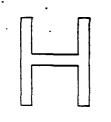

WARNING: Excessive use of a non-recommended lubricant could cause serious function problems possibly leading to accidental firing.

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

R2539671

NG

#### TO ASSEMBLE THE MODELS WITHOUT A FLOOR PLATE

- 1. Put the magazine follower and the spring into the magazine.
- 2. Put the stock over the receiver and trigger assembly.
- 3. Replace and tighten the screws on the trigger guard.

WARNING: Before you replace the bolt assembly, make sure the barrel is free of obstructions.

4. Replace the bolt assembly. See Instruction on Page 5.

WARNING: After cleaning the trigger assembly, check the chamber and magazine to make sure there are no cartridges in the firearm. Put the safety switch in the "F" position. Close the bolt smartly. The firing pin must remain cocked. To check, pull the trigger. The firing pin must fall. Repeat the test at least ten times. If the firing pin will not remain cocked when the bolt is closed smartly, return the firearm to the factory, or a REM-INGTON RECOMMENDED GUNSMITH.

- TO ASSEMBLE THE MODELS WITH A FLOOR PLATE 1. Put the magazine all the way into the bottom of the receiver.
- 2. Assemble the trigger guard assembly on the stock.
- 3. Put the stock over the receiver and trigger assembly.
- 4. Replace and tighten the trigger guard screws.

13

## 5. Cose the Floor Plate.

WARNING: Before you replace the bolt assembly, make sure the barrel is free of obstructions.

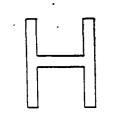

6. Replace the bolt assembly. See Instruction on Page 5.

chaning th rigger assembly, check the WARNING: After chamber and magazing the firearm. Put the the bolt smartly. The here are no cartridges in the "F" position. Close make satery switch the bolt smartly. The pull the trigger. The firing pin remain cocked. To check, all. Repeat the test at least hus fing must ten times. If the firing pin will not remain cocked when the bolt is closed smartly, return the firearm to the factory, or a REMis closed smartly, return the firearm to t INGTON RECOMMENDED GUNSMITH.

#### CLEANING FREQUENCY

- 1. Before and after long term storage.
- 2. If the rifle has been subjected to adverse conditions; such as, shooting in the rain, snow, sleet, or in sal, water areas.
- 3. If the rifle is exposed to dirty conditions (such as) laying on the ground outdoors, dropped in mud, etc.

## CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

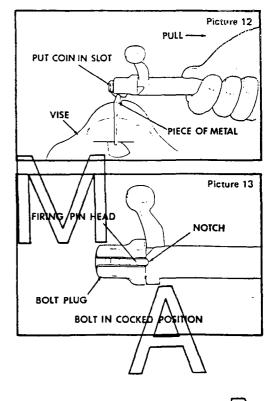

#### TO DISASSEMBLE THE BOLT FOR CLEANING

- 1. Remove the bolt assembly from the firearm. See Instruc-tion on Page 5.
- Put the notch on the firing pin head over a metal edge. Pull the bolt assembly away from the firing pin. Put a coin into the slot near the back edge of the firing pin head. See Picture 12. 2.
- Hold the bolt assembly and turn the bolt plug clockwise until the firing pin assembly can be removed from the bolt assembly.
- CAUTION: Clean the firng pin assembly as a unit. 4. Clean all parts with gun cleaning solvent. Dry with a clean cloth. Apply a thin coat of Rem<sup>tm</sup> Oil.
- 5.
- TO ASSEMBLE 1. Put the firing pin assembly into the rear of the bolt assem-
- blv. 2. Tighten the bolt plug into the bolt assembly with your
- hand.
- Pull the coin from the slot in the firing pin head.
   Turn the bolt plug until the firing pin head goes into the small notch on the rear rim of the bolt. The bolt is now cocked. See Picture 13. NOTE: The bolt must be cocked to be assembled into
  - the rifle.
- 5. Assemble the bolt assembly into the rifle. See Instructions on Page 5.

14

HOW TO ORDER PARTS FROM THE REMINGTON ACTORY

#### TO ORDER PARTS

Arms Service - Parts (315) 895-7393

- 1. Use the picture on page 16 to find the correct part name and number.
- Write the model and serial number of your firearm, and the part name and number on the parts order.
- 3. Send parts order to:

Arms Service Division Remington Arms Company, Inc. Ilion, New York 13357

 We can ship your order on a C.O.D. basis or provide an estimate of your required remittance. NOTE: Bolts, barrels, or receivers for centerfire

rifles, pistols, and rimfire rifles are not sold separately. Repairs or replacements for these parts must be done by Remington Arms Company, Inc. Barrels and bolts for shotguns are available as parts.

WARNING: Use only Remington parts in Remington firearms.

#### TO ORDER FACTORY SERVICE:

15

Arms Service - Repairs (315) 895-7791

Write a short description of the problem.

 Give the model and serial number. Make a copy of this note. Attach the original note to the flrearm, and put the copy in an envelope attached to the outside of the shipping box.

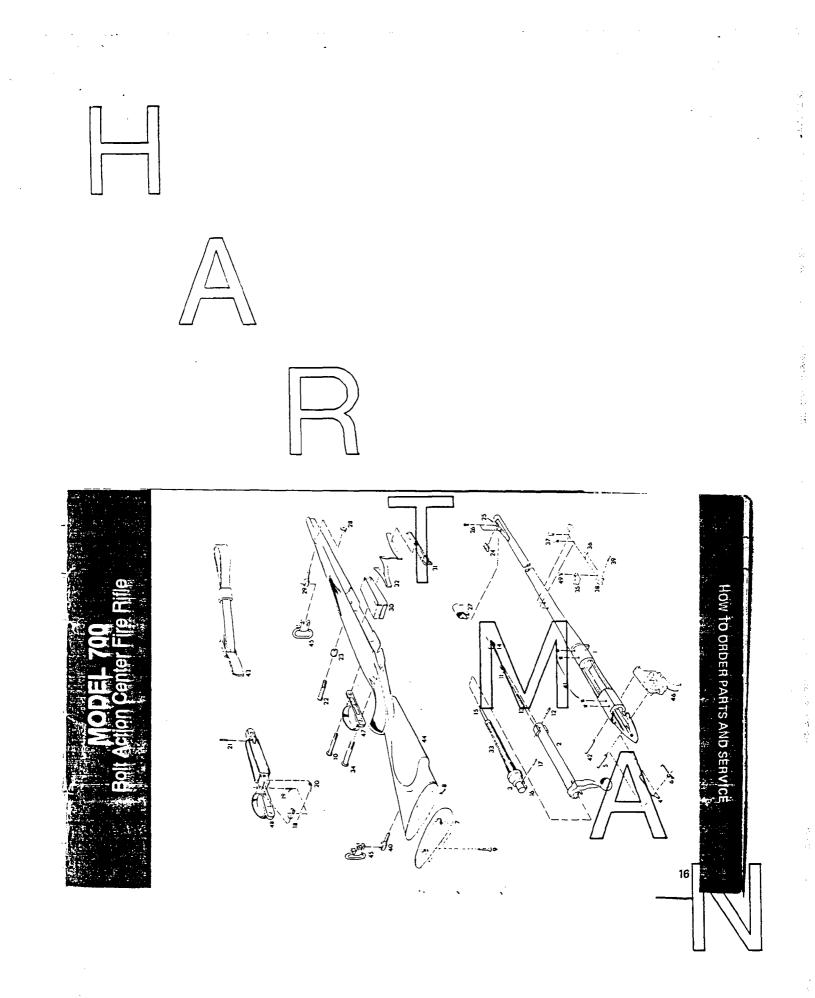

- 2. Make sure the gun is unloaded. Never include any ammunition in the package with the firearm.
- Send by either United Parcel Service or Parcel Post. NOTE: Make sure the gun is unloaded, and therepis-go ammunition in the box.
- 4. Get insurance for the firearm.
- 5. Record serial number, it is required when calling factory to inquire a firearm has been received for repairs
- 6. Send finearns for factory service to: Arrus Service Division Reminston Access Company, Inc. Ilion, New York 13357

#### INSTRUCTION BOOKS:

To get instruction books for any Remindron firearm, write to Remindron Arms Co., Inc., Anns Service Division, Hion, New York 13357 Give the model, serial number, gauge or caliber.

⊥ Dec.'89

The purpose of the New Bolt Action Rifle (N'BAR) is to offer a replacement for the M/700 'BDL' Rifle currently being produced. The new design parameters will include:

- o Detachable Magazine Box
  - Improved Fire Control

0

- Nø\Connector
  - / Two Trigger Pull Springs (Low Rate Spring)
  - -/ Sealed Fire Control
  - -/ /Balanded Trigger
  - Trigger & Sear Block
  - Non-Retrofittable to M/700
- o Bolt Lock w/Override
- New Scope Mounts Possibly aftermarket bases and rings. To be offered with rifle package.
- o New Extractor System
- o New 'Custom Shop<u>Barre</u>l Contour - Mountain Ri<del>fle</del> Grown
- o Improved Bedding Accuracy Features Example:
  - Thicker barrel bracket
  - Relieved thread rec. fit & full hub bearing
- o M/700 Receiver to start with same round blank size and cosmetically altered behind front ring of steel over locking lugs.
- New Wood Stock Cosmetically altered for fittings/dress up/checkering

The "N'Bar" Design features will initially be produced in five calibers (30-06, 270, 280, 25-06 & 7MM Mag.) during the first year of introduction. These design/cost estimates are based strictly on introduction of these five calibers only in long action standard and mag. calibers only. If at a later point in time other calibers and short actions are added to this program, they will have additional development and introduction costs added.

- Initial Design

This includes preliminary experimental development work, sketches, scenarios, layouts, design, computer modeling, detailing and checking. This design will be a redesign of the existing M/700 Rifle currently in our line, only in those areas so stated above in the design parameters section. Short actions and additional calibers will be considered during initial design to allow them to be compatible for design inclusion at a Tater time. Personnel required to accomplish this will include: one Research Engineer full time, one Cad Designer and one CAD Detailer, and one Research Engineer 50% of time, as well as some part time help from one EDL Engineer, Model Maker, N/C Programmer & Tester.

- Send Vendor Parts Out For Manufacturability and Quotation Estimate Jan.'89 - May'90

Early vendor consultation and input is required due to many parts for detachable magazine box, fire control, scope mounts and extractor being vendor supplied parts with long lead times and vendor development input requirements for the design. 'High spot' estimates will be pursued early to determine feasibility of producing at a competitive cost. We will also look at after market products already developed, such as quick klip for a detachable magazine box and numerous scope mount/ring manufactures. A decision will have to be made at this time for project direction to go with a total Remington design magazine box or after market adaptation.

- Build Initial Design Prototype Guns

Sept.'89 - Jan?'90

At least three prototype guns will be built: one in cal. 30-06 to cover similar calibers of 280, 270, 25-06, one in 7MM Rem. Mag. for Mag. Cal. and one for esthetic evaluation in standard head size caliber. All common parts with M/700 will be procured from the the plant, current inventory. All newly designed parts will be fabricated by Remington where possible or be developed by outside vendors with Engineering/Development assistance from Remington. Personnel required will be: one Research Engineer, one CAD Designer, one CAD Detailer, one N/C Programmer part time and two Model Makers full time, one part time.

- Initiate Design Review Team Analysis

Dec.'89 - Feb.'90

Their purpose will be to review design at this point and look at design objectively. Input is necessary from Process Engineering, Chemical/Materials Engineering, Arms Service feedback, Legal, as well as other Designers. Each group will review design as to potential 'Roadblocks' and feasibility to produce an acceptable design.

#### - Test Phase I Prototypes

Jan.'90 - Feb.'90

The two test prototypes - one standard caliber and one magnum caliber will be preliminary tested as to fit, form and function. These test guns will show up any major or minor design shortcomings prior to building multiple test guns for evaluation of function, accuracy, endurance. Testing will consist of dry firing/cycle, live firing, function and accuracy. Extended testing of one or both guns may be desired at this time depending on preliminary functioning results.

# CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

PAGE 4

- Test Phase I Prototypes - Cont'd.

A Marketing/Sales Manager Meeting will be held to evaluate styling, aesthetics, features utilizing the third prototype gun built. Their decisions will affect time for redesign and rebuild of models for both testing and aesthetics. Personnel required are: one Research Engineer full time, part time allowances for one EDL Engineer, one Model Maker, one CAD Designer and one Tester.

- Redesign (Decision Point)

Feb.'90 - May'90

Redesign begins as soon as problems arise in Phase I assembly or testing, and continues through Phase I Testing. Depending on the extent and nature of parts requiring redesign as a result of testing, Marketing, Legal or Design Review Team recommendations, will greatly affect straight forward progress or delays for redesign, reevaluation and retesting. Depending on how much and how many components need attention will constitute a need for additional personnel such as: one Research Engineer, one EDL Engineer, one CAD Designer, one CAD Detailer, one Model Maker full or part time. Styling, stock design, weight, balance, safety will need to be addressed at this phase. Also, high spot economics of the whole program will need to be completed at this time, and evaluated to determine project feasibility and path forward or redesign.

- Build Phase II Design Samples

May'90 - Aug.'90

A total of 15 design sample guns will be built (3 of each caliber) for this Phase II. The majority of the design, legal, and styling questions will be resolved during this phase. As many vendor sample prototype parts as are available, will be used. Other non-vendor parts will be made by Production, Model Shop or N/C Shop. Ongoing vendor visits will be required to consult and fabricate test sample parts from vendor temporary tooling. Some in-house finishing of these vendor components will be necessary by the Model Shop or N/C. Personnel required to implement this Phase II are: four Model Makers and two Engineers will be required full time, one N/C Programmer full time.

- Test Phase II Design Samples

Auq.'90 - Oct

These design sample guns will be tested for function, endurance, strength, blow/up, crud and temperature extreme tests, safety performance, dry firing and field function. Two 30-06 and two 7MM Rem. Mag. guns will be subjected to an intentional abuse test. This may constitute some design changes or modification as deemed necessary from test results. Personnel required are: one Engineer and two testers will be required full time and one Model Maker and N/C Designer part time.

PAGE 6

1.11.55

- Mini Redesign and Drawing Transmittal July'91

By this phase of development, the design is firm and no major setbacks should occur. Only minor changes or updates should take place. Changes will be limited to process updates, improving endurance, cost effectiveness, and improved functionality only on parts found to be problem areas from previous testing. Initial transmittal of Research Model drawings and specifications takes place at this time. Personnel required are: one Engineer and one CAD praftsman full time.

# - Project Approval (Decision Point)

July'91 - Aug.'91

During this period, final management approval of the design is given and money is released to begin production tooling. All pertinent economics and production process estimates will be completed for this project approval report.

- Draft Manuals

Aug.'91 - Oct.'91

This involves development of text and illustrations for the owners manuals and instruction booklets and field service manuals. This will be prepared in conjunction with a commerical printer. Personnel required are: one Engineer and one Draftsman part time with input required from Legal Department and Customer Service.

A decision will have to be made at this time for project direction to go with a total Remington design magazine box or after market adaptation.

- Build Initial Design Prototype Guns

Aug.'89 - Apr.'90

At least three prototype guns will be built: one in cal. 30-06 to cover similar calibers of 280, 270, 25-06, one in 7MM Rem. Mag. for Mag. Cal. and one for esthetic evaluation in standard head size caliber. All common parts with M/700 will be procured from the the plant, current inventory. All newly designed parts will be fabricated by Remington where possible or be developed by outside vendors with Engineering/Development assistance from Remington. Personnel required will be: one Research Engineer, one CAD Designer, one CAD Detailer, one N/C Programmer part time and one Model Maker full time, one part time.

# - Initiate Design Review Team Analysis Mar.'90 - May'90

Their purpose will be to review design at this point and look at design objectively. Input is necessary from Process Engineering, Chemical/Materials Engineering, Arms Service feedback, Legal, as well as other Designers. Each group will review design as to potential 'Roadblocks' and feasibility to produce an acceptable design.

### - Test Phase I Prototypes

#### Apr.'90 - May'90

The two test prototypes - one standard caliber and one magnum caliber will be preliminary tested as to fit, form and function. These test guns will show up any major or minor design shortcomings prior to building multiple test guns for evaluation of function, accuracy, endurance. Testing will consist of dry firing/cycle, live firing, function and accuracy. Extended testing of one or both guns may be desired at this time depending on preliminary functioning results.

R2539723

ŀ

PAGE 4

## - Test Phase I Prototypes - Cont'd.

A Marketing/Sales Manager Meeting will be held to evaluate styling, aesthetics, features utilizing the third prototype gun built. Their decisions will affect time for redesign and rebuild of models for both testing and aesthetics. Personnel required are: one Research Engineer full time, part time allowances for one EDL Engineer, one Model Maker, one CAD Designer and one Tester.

#### - Redesign (Decision Point)

# May'90 - Aug.'90

Redesign begins as soon as problems arise in Phase I assembly or testing, and continues through Phase I Testing. Depending on the extent and nature of parts requiring redesign as a result of testing, Marketing, Legal or Design Review Team recommendations, will greatly affect straight forward progress or delays for redesign, reevaluation and retesting. Depending on how much and how many components need attention will constitute a need for additional personnel such as: one Research Engineer, one EDL Engineer, one CAD Designer, one CAD Detailer, one Model Maker full or part time. Styling, stock design, weight, balance, safety will need to be addressed at this phase. Also, high spot economics of the whole program will need to be completed at this time, and evaluated to determine project feasibility and path forward or redesign.

# - Build Phase II Design Samples

#### July'90 - Jan.'91

A total of 15 design sample guns will be built (3 of each caliber) for this Phase II. The majority of the design, legal, and styling questions will be resolved during this phase. As many vendor sample prototype parts as are available, will be used. Other non-vendor parts will be made by Production, Model Shop or N/C Shop. Ongoing vendor visits will be required to consult and fabricate test sample parts from vendor temporary tooling. Some in-house finishing of these vendor components will be necessary by the Model Shop or N/C. Personnel required to implement this Phase II are: two Model Makers and one Engineer will be required full time, one N/C Programmer part time.

#### - Test Phase II Design Samples

Jan.'91 - Mar./'9

These design sample guns will be tested for function, endurance, strength, blow/up, crud and temperature extreme tests, safety performance, dry firing and field function. Two 30-06 and two 7MM Rem. Mag. guns will be subjected to an intentional abuse test. This may constitute some design changes or modification as deemed necessary from test results. Personnel required are: one Engineer and two testers will be required full time and one Model Maker and N/C Designer part time.

PAGE 5

- Redesign

### Feb.'91 - May'91

Redesign begins as soon as problems arise during Phase II Testing and continues throughout testing. The test results will determine redesign effort needed to correct any deficiencies of the design. All styling, Marketing, and Legal concerns will be finalized by this time. If a major redesign or management change in criteria is required a substantial amount of time and effort will be required to complete. Personnel required will be one EDL Engineer, one Research Engineer, one CAD Designer, one CAD Detailer will be required full time.

## - Build Design Acceptance Guns

Mar.'91 - Mar.'92

Apr.'92 - June'92

The purpose of the design acceptance test is for finalizing design component parts to be fully tested in several guns prior to design transmittal to the plant. A total of 30 guns will be built including all five calibers for a large enough sample to be statistically sound. The majority of parts will be vendor produced parts on permanent tooling and in-house parts produced as much as possible on production machinery that will be used in the process of full production schedules. Some component parts may need finishing operations by the R & D Model Shop or N/C Shop. Also, N/C will aid FMS Operations for programming and debugging. Other current production parts required as used, or if in need of modifications will be procured from the plant. Personnel required will be: one Engineer, one N/C Programmer and one Model Maker full time. Some plant personnel will be required part time.

# - Test Design Acceptance Guns

Design acceptance testing of 30 gun samples is the final test performed on the design prior to transmittal. No alterations or modifications are allowed during this testing phase to the test guns. The Test Lab has complete control of the testing and performs all testing it deems necessary to verify design for release to production. Control Gun Testing will be run concurrently with New Design Acceptance Test Guns to compare current design with new offering, also to include competitive products where appropriate. Testing will include endurance field function, drop, dry fire, strength, intentional abuse, temperature extreme, solvent testing and accuracy. When the Lab has passed these guns on all tests, a written report certifying the gun is acceptable for transmittal is filed. Personnel required are: one Engineer and four Test Lab personnel full time.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

PAGE 6

- Nini Redesign and Drawing Transmittal July'92

By this phase of development, the design is firm and no major setbacks should occur. Only minor changes or updates should take place. Changes will be limited to process updates, improving endurance, cost effectiveness, and improved functionality only on parts found to be problem areas from previous testing. Initial transmittal of Research Model drawings and specifications takes place at this time. Personnel required are: one Engineer and one CAD Draftsman full time.

- Project Approval (Decision Point)

July'92 - Aug.'92

During this period, final management approval of the design is given and money is released to begin production tooling. All pertinent economics and production process estimates will be completed for this project approval report.

- Draft Manuals

Aug.'92 - Oct.'92

This involves development of text and illustrations for the owners manuals and instruction **booklets** and field service manuals. This will be prepared in conjunction with a commerical printer. Personnel required are: one Engineer and one Draftsman part time with input required from Legal Department and Customer Service.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

#### NEW BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 2

The purpose of the New Bolt Action Rifle (N'BAR) is to offer a replacement for the M/700 'BDL' Rifle currently being produced. The new design parameters will include:

- 0 Detachable Magazine Box Improved Fire Control 0
  - No Connector Two Trigger Pull Springs (Low Rate Spring) Sealed Fire Control
  - Balanced Trigger
  - Trigger & Sear Block
  - Non-Retrofittable to M/700
- Bolt Lock w/Override 0

Ð

- New Scope Mounts Possibly aftermarket bases and rings. To 0 be offered with rifle package.
- New Extractor System 0 0
- New 'Custom Shop' Barrel Contour Mountain Rifle Crown Improved Bedding Accuracy Features 0
- Example: Thicker barrel bracket
  - Relieved thread rec. fit & full hub bearing
- M/700 Receiver to start with same round blank size and 0 cosmetically altered behind front ring of steel over locking lugs.
- New Wood Stock Cosmetidally altered for fittings/dress 0 up/checkering

The "N'Bar" Design features will initially be produced in five calibers (30-06, 270, 280, 25-06 & 7MM Mag.) during the first year of introduction. These design/cost estimates are based strictly on introduction of these five calibers only in long action standard and mag. calibers only. If at a later point in time other calibers and short actions\_are added\_to this program, they will have additional development and introduction costs added.

### - Initial Design

This includes preliminary experimental development work, sketches, scenarios, layouts, design, computer modeling, detailing and checking. This design will be a redesign of the existing M/700 Rifle currently in our line, only in those areas so stated above in the design parameters section. Short actions and additional calibers will be considered during inft/al design to allow them to be compatible for design inclusion /atalater time. Personnel required to accomplish this will include one Research Engineer full time, one Cad Designer and  $\phi n \in CAD$ Detailer, and one Research Engineer 50% of time, as well as some part time help from one EDL Engineer, Model Maker, N/C Programmer & Tester.

**Jan 189 - Dec.189** 

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

- Send Vendor Parts Out For Jan.'89 - May'90 Manufacturability and Quotation Estimate

Early vendor consultation and input is required due to many parts for detachable magazine box, fire control, scope mounts and extractor being vendor supplied parts with long lead times and vendor development input requirements for the design. 'High spot' estimates will be pursued early to determine feasibility of producing at a competitive cost. We will also look at after market products already developed, such as quick klip for a detachable magazine box and numerous scope mount/ring manufactures. A decision will have to be made at this time for project direction to go with a total Remington design magazine box or after market adaptation.

- Build Initial Design Prototype Guns Sept.'89 - Jan.'90

At least three prototype guns will be built: one in cal. 30-06 to cover similar calibers of 280, 270, 25-06, one in 7MM Rem. Mag. for Mag. Cal. and one for esthetic evaluation in standard head size caliber. All common parts with M/700 will be procured from the the plant, current inventory. All newly designed parts will be fabricated by Remington where possible or be developed by outside vendors with Engineering/Development assistance from Remington. Personnel required will be: one Research Engineer, one CAD Designer, one CAD Detailer, one N/C Programmer part time and two Model Makers full time, one part time.

- Initiate Design Review Team Analysis Dec.'89 - Feb.'90

Their purpose will be to review design at this point and look at design objectively. Input is necessary from Process Engineering, Chemical/Materials Engineering, Arms Service Teedback, Legal, as well as other Designers. Each group will review design as to potential 'Roadblocks' and feasibility to produce an acceptable design.

- Test Phase I Prototypes

The two test prototypes - one standard caliber and one magnum caliber will be preliminary tested as to fit, form and function. These test guns will show up any major or minor design shortcomings prior to building multiple test guns for evaluation of function, accuracy, endurance. Testing will consist of dry firing/cycle, live firing, function and accuracy. Extended testing of one or both guns may be desired at this time depending on preliminary functioning results.

Jan.'90 - Feb.'90

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER **KINZER V. REMINGTON** 

201120

- Test Phase I Prototypes - Cont'd.

A Marketing/Sales Manager Meeting will be held to evaluate styling, aesthetics, features utilizing the third prototype gun built. Their decisions will affect time for redesign and rebuild of models for both testing and aesthetics. Personnel required are: one Research Engineer full time, part time allowances for one EDL Engineer, one Model Maker, one CAD Designer and one Tester.

- Redesign (Decision Point)

Feb.'90 - May'90

Redesign begins as soon as problems arise in Phase I assembly or testing, and continues through Phase I Testing. Depending on the extent and nature of parts requiring redesign as a result of testing, Marketing, Legal or Design Review Team recommendations, will greatly affect straight forward progress or delays for redesign, reevaluation and retesting. Depending on how much and how many components need attention will constitute a need for additional personnel such as: one Research Engineer, one EDL Engineer, one CAD Designer, one CAD Detailer, one Model Maker full or part time. Styling, stock design, weight, balance, safety will need to be addressed at this phase. Also, high spot economics of the whole program will need to be completed at this time, and evaluated to determine project feasibility and path forward or redesign.

- Build Phase II Design Samples

May'90 - Aug.'90

A total of 15 design sample guns will be built (3 of each caliber) for this Phase II. The majority of the design, legal, and styling questions will be resolved during this phase. As many vendor sample prototype parts as are available, will be used. Other non-vendor parts will be made by Production, Model Shop or N/C Shop. Ongoing vendor visits will be required to consult and fabricate test sample parts from vendor temporary tooling. Some in-house finishing of these vendor components will be necessary by the Model Shop or N/C. Reference required to implement this Phase II are: four Model Makers and two Engineers will be required full time, one N/C Programmer full time.

- Test Phase II Design Samples

Aug.'90 - - Oct.'90

These design sample guns will be tested for function, endurance, strength, blow/up, crud and temperature extreme tests, safety performance, dry firing and field function. Two 30-06 and two 7MM Rem. Mag. guns will be subjected to an intentional abuse test. This may constitute some design changes or modification as deemed necessary from test results. Personnel required are: one Engineer and two testers will be required full time and one Model Maker and N/C Designer part time. NEW BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 5

#### - Redesign

Nov.'90 - Apr.'91

Redesign begins as soon as problems arise during Phase II Testing and continues throughout testing. The test results will determine redesign effort needed to correct any deficiencies of the design. All styling, Marketing, and Legal concerns will be finalized by this time. If a major redesign or management change in criteria is required a substantial amount of time and effort will be required to complete. Personnel required will be one EDL Engineer, one Research Engineer, one CAD Designer, one CAD Detailer will be required full time.

# - Build Design Acceptance Guns

The purpose of the design acceptance test is for finalizing design component parts to be fully tested in several guns prior to design transmittal to the plant. A total of 30 guns will be built including all five calibers for a large enough sample to be statistically sound. The majority of parts will be vendor produced parts on permanent tooling and in-house parts produced as much as possible on production machinery that will be used in the process of full production schedules. Some component parts may need finishing operations by the R & D Model Shop or N/C Shop. Also, N/C will aid FMS Operations for programming and debugging. Other current production parts required as used, or if in need of modifications will be procured from the plant. Personnel required will be: two Engineers, two N/C Programmers and two Model Makers full time. Some plant personnel will be required part time.

#### - Test Design Acceptance Guns

May'91 - July'91

Design acceptance testing of 30 gun samples is the final test performed on the design prior to transmittal. No alterations or modifications are allowed during this testing phase to the test guns. The Test Lab has complete control of the testing and performs all testing it deems necessary to verify design for release to production. Control Gun Testing will be run concurrently with New Design Acceptance Test Guns to compare current design with new offering, also to include competitive products where appropriate. Testing will include endurance, field function, drop, dry fire, strength, intentional abuse, temperature extreme, solvent testing and accuracy. When the Test Lab has passed these guns on all tests, a written report certifying the gun is acceptable for transmittal is filed. Personnel required are: one Engineer and four Test Lab personnel full time.

ł

- Mini Redesign and Drawing Transmittal July'91

By this phase of development, the design is firm and no major setbacks should occur. Only minor changes or updates should take place. Changes will be limited to process updates, improving endurance, cost effectiveness, and improved functionality only on parts found to be problem areas from previous testing. Initial transmittal of Research Model drawings and specifications takes place at this time. Personnel required are: one Engineer and one CAD Draftsman full time.

- Project Approval (Decision Point) July'91 - Aug.'91

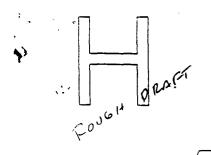

During this period, final management approval of the design is given and money is released to begin production tooling. All pertinent economics and production process estimates will be completed for this project approval report.

- Draft Manuals

Aug.'91 - Oct.'91

This involves development of text and illustrations for the owners manuals and instruction booklets and field service manuals. This will be prepared in conjunction with a commerical printer. Personnel required are: one Engineer and one Draftsman part time with input required from Legal Department and Customer Service.

NEN BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 2
The purpose of the New Bolt Action Rifle (N'BAR) is to offer a
replacement for the M/700 'BDL' Rifle currently being produced. The new design parameters will include:
ine new design parameters will include:
o Detachable Magazine Box
o Improved Fire Control
-/ (No) Connector
/ Two Trigger Pull Springs (Low Rate Spring)
/-/ Sealed Fire Control
← Balanced Trigger - Trigger & Sear Block
- Non-Retrofittable to M/700
o Bolt Lock w/Override
o New Scope Mounts - Possibly aftermarket bases and rings. To
be offered with rifle) package.
o New Extractor System
o New 'Custom Shop' Barrel Contour
- Mountain Rifle drown
o Improved Bedding/Accuracy Features Example:
- Thicker barrel bracket
- Relieved thread - rec. fit & full hub bearing
o M/700 Receiver to start with same round blank size and
cosmetically altered behind front ring of steel over locking
lugs.
<ul> <li>New Wood Stock - Cosmetically altered for fittings/dress</li> </ul>
up/checkering
The "N'Bar" Design features will initially be produced in five
calibers (30-06, 270, 280, 25-06 & 7MM Mag.) during the first
year of introduction. These design/cost estimates are based
strictly on introduction of these five calibers only in long
action standard and mag. calibers only. If at a later point in
time other calibers and short actions are added to this program, they will have additional development and introduction costs
added.
$\Box  \lor  \Box$
- Initial Design Jan.'89 -June'90
This includes preliminary experimental development work,
sketches, scenarios, layouts, design, computer modeling,
detailing and checking. This design will be a redesign of /the
existing M/700 Rifle currently in our line, only in those areas

existing M/700 Rifle currently in our line, only in those areas so stated above in the design parameters section. Short actions and additional calibers will be considered during initial design to allow them to be compatible for design inclusion at a later time. Personnel required to accomplish this will include: one Research Engineer full time, one Cad Designer and one CAD Detailer, 50% of time, as well as some part time help from one EDL Engineer, Model Maker, N/C Programmer & Tester.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

.

ALLES AND APPLY

- Test Phase I Prototypes

design.

The two test prototypes - one standard caliber and one magnum caliber will be preliminary tested as to fit, form and fingthion. These test guns will show up any major or minor design / shortcomings prior to building multiple test guns for evaluation of function, accuracy, endurance. Testing will consist of dry firing/cycle, live firing, function and accuracy. Ext/ended testing of one or both guns may be desired at this time depending on preliminary functioning results.

Mar.'90 - May'90 - Initiate Design Review Team Analysis

At least three prototype guns will be built: one in cal. 30-06 to cover similar calibers of 280, 270, 25-06, one in 7MM Rem. Mag. for Mag. Cal. and one for esthetic evaluation in standard head size caliber. All common parts with M/700 will be procured from the the plant, current inventory. All newly designed parts will be fabricated by Remington where possible or be developed by outside vendors with Engineering/Development assistance from Remington. Personnel required will be: one Research Engineer, one CAD Designer, one CAD Detailer, one N/C Programmer part time and one Model Maker full time, one part time.

Their purpose will be to review design at this point and look at design objectively. Input is necessary from Process Engineering,

Chemical/Materials Engineering, Arms Service feedback, Legal, as well as other Designers. Each group will review design as to potential 'Roadblocks' and feasibility to produce an acceptable design

- Build Initial Design Prototype Guns

Early vendor consultation and input is required due to many parts for detachable magazine box, fire control, scope mounts and extractor being vendor supplied parts with long lead times and vendor development input requirements for the design. 'High spot' estimates will be pursued early to determine feasibility of

producing at a competitive cost. We will also look at after market products already developed, such as quick klip for a detachable magazine box and numerous scope mount/ring manufactures. A decision will have to be made at this time for project direction to go with a total Remington design magazine

NEW BOLT ACTION RIFLE (N'BAR) - (CONT'D.) PAGE 3

Manufacturability and Quotation Estimate

Send Vendor Parts Out For

box or after market adaptation.

# Apr.'90 - May'90

Aug.'89 - Apr.'90

Jan.'89 - Jan.'91

#### - Test Phase I Prototypes - Cont'd.

A Marketing/Sales Manager Meeting will be held to evaluate styling, aesthetics, features utilizing the third prototype gun built. Their decisions will affect time for redesign and rebuild of models/for both testing and aesthetics. Personnel required are: one Research Engineer full time, part time allowances for one EDL Engineer, one Model Maker, one CAD Designer and one Tester.

## - Redesign (Decision Point)

## May'90 - Aug.'90

Redesign begins as soon as problems arise in Phase I assembly or testing, and continues through Phase I Testing. Depending on the extent and nature of parts requiring redesign as a result of testing, Marketing, Legal or Design Review Team recommendations, will greatly affect straight forward progress or delays for redesign, reevaluation and retesting. Depending on how much and how many components need attention will constitute a need for additional personnel such as: one Research Engineer, one EDL Engineer, one CAD Designer, one CAD Detailer, one Model Maker full or part time. Styling, stock design, weight, balance, safety will need to be addressed at this phase. Also, high spot economics of the whole program will need to be completed at this time, and evaluated to determine project feasibility and path forward or redesign.

- Build Phase II Design Samples

July'90 - Jan.'91

A total of 15 design sample guns will be built (3 of each caliber) for this Phase II. The majority of the design, legal, and styling questions will be resolved during this phase. As many vendor sample prototype parts as are available, will be used. Other non-vendor parts will be made by Production, Model Shop or N/C Shop. Ongoing vendor visits will be required to consult and fabricate test sample parts from vendor temporary tooling. Some in-house finishing of these vendor components will be necessary by the Model Shop or N/C. Personnel required to implement this Phase II are: two Model Makers and one Engineer will be required full time, one N/C Programmer part time.

#### - Test Phase II Design Samples

Jan.'91 - May./

These design sample guns will be tested for function, endurance, strength, blow/up, crud and temperature extreme tests, safety performance, dry firing and field function. Two 30-06 and two 7MM Rem. Mag. guns will be subjected to an intentional abuse test. This may constitute some design changes or modification as deemed necessary from test results. Personnel required are: one Engineer and two testers will be required full time and one Model Maker and N/C Designer part time.

NEW BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 5

#### Redesign

# Feb.'91 - May'91

Redesign begins as soon as problems arise during Phase II Testing and continues throughout testing. The test results will determine redesign effort needed to correct any deficiencies of the design. All styling, Marketing, and Legal concerns will be finalized by this time. If a major redesign or management change in criteria is required a substantial amount of time and effort will be required to complete. Personnel required will be one EDL Engineer, one Research Engineer, one CAD Designer, one CAD Detailer will be required full time.

# - Build Design Acceptance Guns

#### Mar.'91 - Mar.'92

Apr. '92 - June'92

The purpose of the design acceptance test is for finalizing design component parts to be fully tested in several guns prior to design transmittal to the plant. A total of 30 guns will be built including all five calibers for a large enough sample to be statistically sound. The majority of parts will be vendor produced parts on permanent tooling and in-house parts produced as much as possible on production machinery that will be used in the process of full production schedules. Some component parts may need finishing operations by the R & D Model Shop or N/C Shop. Also, N/C will aid FMS Operations for programming and debugging. Other current production parts required as used, or if in need of modifications will be procured from the plant. Personnel required will be: one Emgineer, one N/C Programmer and one Model Maker full time. Some plant personnel will be required part time.

#### - Test Design Acceptance Guns

Design acceptance testing of 30 gun samples is the final test performed on the design prior to transmittal No alterations or modifications are allowed during this testing phase to the test guns. The Test Lab has complete control of the testing and performs all testing it deems necessary to verify design for release to production. Control Gun Testing will be run concurrently with New Design Acceptance Test Guns to compare current design with new offering, also to include competitive products where appropriate. Testing will include endurance. field function, drop, dry fire, strength, intentional abuse temperature extreme, solvent testing and accuracy. When the Lab has passed these guns on all tests, a written report certifying the gun is acceptable for transmittal is filed. Personnel required are: one Engineer and four Test Lab personnel full time.

æ

Telline - Milline Inc.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

## - Mini Redesign and Drawing Transmittal July'92

By this phase of development, the design is firm and no major setbacks should occur. Only minor changes or updates should take place. Changes will be limited to process updates, improving endurance, cost effectiveness, and improved functionality only on parts found to be problem areas from previous testing. Initial transmittal of Research Model drawings and specifications takes place at this time. Personnel required are: one Engineer and one CAP Draftsman full time.

- Project Approval (Decision Point) July'92 - Aug.'92

During this period, final management approval of the design is given and money is released to begin production tooling. All pertinent economics and production process estimates will be completed for this project approval report.

- Draft Manuals

Aug.'92 - Oct.'92

This involves development of text and illustrations for the owners manuals and instruction <u>booklets</u> and field service manuals. This will be prepared in conjunction with a commerical printer. Personnel required are: one Engineer and one Draftsman part time with input required from Legal Department and Customer Service.

### CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

TELEVISION CONTRACTOR

2012-112-

The purpose of the New Bolt Action Rifle (N'BAR) is to offer a replacement for the M/700 'BDL' Rifle currently being produced. The new design parameters will include:

- o Detachable Magazine Box
- o Improved Fire Control
  - No Connector
  - T/wp/ Trigger Pull Springs (Low Rate Spring)
  - \$ealed Fire Control
  - /Balanded Trigger
  - / Trigger & Sear Block
  - - Non-Retrofittable to M/700
- o Bolt Lock w/Override
- New Scope Mounts Possibly aftermarket bases and rings. To be offered with rifle package.
- o New Extractor System
- o New 'Custom Shop' Barrel Contour
  - Mountain Rif<u>le C</u>rown
- o Improved Bedding Accuracy Features Example:
  - Thicker barrel bracket
  - Relieved thread rec. fit & full hub bearing
- M/700 Receiver to start with same round blank size and cosmetically altered behind front ring of steel a locking lugs.
- o New Wood Stock Cosmetically altered for fittings/dress up/checkering

The "N'Bar" Design features will initially be produced in five calibers (30-06, 270, 280, 25-06 & 7MM Mag.). douring the first year of introduction Twhese design/cost estimates are based strictly on introduction of these five calibers only in long action standard and mag. calibers only. If at a later point in time other calibers and short actions are added to this program, they will have additional development and introduction costs added.

#### - Initial Design

Jan.'89 -June'90

This includes preliminary experimental development work, sketches, scenarios, layouts, design, computer modeling, detailing and checking. This design will be a redesign of the existing M/700 Rifle currently in our line, only in those areas so stated above in the design parameters section. Short actions and additional calibers will be considered during initial design to allow them to be compatible for design inclusion at a later time. Personnel required to accomplish this will include: one Research Engineer, one full time. Cad Designer one CAD Detailer 50% of time, as well as some part time help from one EDL Engineer, Model Maker, N/C Programmer & Tester.

### CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

Send Vendor Parts Out For Jan.'89 - Jan.'91 Manufacturability and Quotation Estimate

Early vendor consultation and input is required due to many parts for detachable magazine box, fire control, scope mounts and extractor being vendor supplied parts with long lead times and vendor development input requirements for the design. 'High spot' estimates will be pursued early to determine feasibility of producing at a competitive cost. We will also look at after market products already developed, such as quick klip for a detachable magazine box and numerous scope mount/ring manufactures. A decision will have to be made at this time for project direction to go with a total Remington design magazine box or after market adaptation.

- Build Initial Design Prototype Guns

Aug.'89 - Apr.'90

At least three prototype suns will be built: one in cal. 30-06 to cover similar calibers of 280, 270, 25-06, one in 7MM Rem. Mag. for Mag. Cal. and one for esthetic evaluation in standard head size caliber. All common parts with M/700 will be procured from the the plant, current inventory. All newly designed parts will be fabricated by Remington where possible or be developed by outside vendors with Engineering/Development assistance from Remington. Personnel required will be: one Research Engineer, one CAD Designer, one CAD Detailer, one N/C Programmer part time and one Model Maker full time, one part time.

### - Initiate Design Review Team Analysis

Mar.'90 - May'90

Their purpose will be to review design at this point and look at design objectively. Input is necessary from Progess Engineering, Chemical/Materials Engineering, Arms Service feedback, Legal, as well as other Designers. Each group will review design as to potential 'Roadblocks' and feasibility to produce an acceptable design.

### - Test Phase I Prototypes

Apr.'90 - May'90

The two test prototypes - one standard caliber and one magnum caliber will be preliminary tested as to fit, form and function. These test guns will show up any major or minor design shortcomings prior to building multiple test guns for evaluation of function, accuracy, endurance. Testing will consist of dry firing/cycle, live firing, function and accuracy. Extended testing of one or both guns may be desired at this time depending on preliminary functioning results.

### CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON

Test Phase I Prototypes - Cont'd.

A Marketing/Sales Manager Meeting will be held to evaluate styling, aesthetics, features utilizing the third prototype gun built. Their decisions will affect time for redesign and rebuild of models for both testing and aesthetics. Personnel required are: one Research Engineer full time, part time allowances for one EDL Engineer, one Model Maker, one CAD Designer and one Tester.

- Redesign (Decision Point)

May'90 - Aug.'90

Redesign begins as soon as problems arise in Phase I assembly or testing, and continues through Phase I Testing. Depending on the extent and nature of parts requiring redesign as a result of testing, Marketing, Legal or Design Review Team recommendations will greatly affect straight forward programs or delays for redesign, reevaluation and retesting. Depending on how much and how many components need attention will constitute a need for additional personnel such as: one Research Engineer, one EDL Engineer, one CAD Designer, one CAD Detailer, one Model Maker full or part time. Styling, stock design, weight, balance, safety will need to be oppressed at this phase. Also, high spot economics of the whole program will need to be completed at this time, and evaluated to determine project feasibility and path forward or redesign.

#### - Build Phase II Design Samples

#### July'90 - Jan.'91

A total of 15 design sample guns will be built (3 of each caliber) for this Phase II. The majority of the design, legal, and styling questions will be resolved during this phase. As many vendor sample prototype parts as are available, will be used. Other non-vendor parts will be made by Production, Model Shop or N/C Shop. Ongoing vendor visits will be required to consult and fabricate test sample parts from vendor temporary tooling. Some in-house finishing of these vendor components will be necessary by the Model Shop or N/C. Personnel required to implement this Phase II are: two Model Makers and one Engineer will be required full time, one N/C Programmer part time.

### - Test Phase II Design Samples

Jan.'91 - Ma/r

These design sample guns will be tested for function, endurance, strength, blow/up, crud and temperature extreme tests, safety performance, dry firing, field function, two 30-06 and two 7MM Rem. Mag. guns will be subjected to an intentional abuse test. This may constitute some design changes or modification as deemed necessary from test results. Personnel required are: one Engineer and two testers will be required full time and one Model Maker and N/C Designer part time.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON ч С

NEW BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 5

- Redesign

Feb.'91 - May'91

Redesign begins as soon as problems arise during Phase II Testing and continues throughout testing. The test results will determine redesign effort needed to correct any deficiencies of the design. All styling, Marketing, and Legal concerns will be finalized by this time. If a major redesign or management change in criteria is required a substantial amount of time and effort will be required to complete. Personnel required will be one EDL Engineer, one Research Engineer, one CAD Designer, one CAD Detailer will be required full time.

- Build Design Acceptance Guns

#### Mar.'91 - Mar.'92

Apr. '9-2 - June'92

The purpose of the design acceptance test is for finalizing design component parts to be fully tested in several guns prior to design transmittal to the plant. A total of 30 guns will be built including all five catibers for a large enough sample to be statistically sound. The majority of parts will be vendor produced parts on permanent tooling and in-house parts produced as much as possible on production machinery that will be used in the process of full production schedules. Some component parts may need finishing operations by the R & D Model Shop or N/C Shop. Also, N/C will aid FMS Operations for programming and debugging. Other current production parts required as used, or if in need of modifications will be procured from the plant. Personnel required will be: one Engineer, one N/C Programmer and one Model Maker full time. Some plant personnel will be required part time.

### - Test Design Acceptance Guns

Design acceptance testing of 30 gun samples is the final test performed on the design prior to transmittal. We alterations or modifications are allowed during this testing phase to the test guns. The Test Lab has complete control of the testing and performs all testing it deems necessary to verify design for release to production. Control Gun Testing will be run concurrently with New Design Acceptance Test Guns to compare current design with new offering, also to include competitive products where appropriate. Testing will include endurance, field function, frop, dry fire, strength, intentional abuse temperature extreme, solvent testing and accuracy. When the Test Lab has passed these guns on all tests, a written report certifying the gun is acceptable for transmittal is filed. Personnel required are: one Engineer and four Test Lab personnel full time. in 11 obten

1. A. A. A. A.

日の時により読

PAGE 6

Mini Redesign and Drawing Transmittal July'92

by this phase of development, the design is firm and no major setbacks should occur. Only minor changes or updates should take place. Changes will be limited to process updates, improving endurance, cost effectiveness, and improved functionality only on parts found to be problem areas from previous testing. Initial transmittal of Research Model drawings and specifications takes place at this time. Personnel required are: one Engineer and one CAD Draftsman full time.

- Project Approval (Decision Point)

July'92 - Aug.'92

During this period, final management approval of the design is given and money is released to begin production tooling. All pertinent economics and production process estimates will be completed for this project approval report.

- Draft Manuals

Aug.'92 - Oct.'92

This involves development of text and illustrations for the owners manuals and instruction booklets and field service manuals. This will be prepared in conjunction with a commerical printer. Personnel required are: one Engineer and one Draftsman part time with input required from Legal Department and Customer Service.

Depending on how much and how many components need attention will constitute a need for additional personnel such as: one Research Engineer, one EDL Engineer, one CAD Designer, one CAD Detailer, one Model Maker full or part time. Styling, stock design, weight, balance, safety will need to be addressed at this phase. Also, high spot economics of the whole program will need to be completed at this time, and evaluated to determine project feasibility and path forward or redesign.

#### - Build Phase II Design Samples

May'90 - Aug.'90

A total of 15 design sample guns will be built (3 of each caliber) for this Phase II. The majority of the design, legal, and styling questions will be resolved during this phase. As many vendor sample prototype parts as are available, will be used. Other non-vendor parts will be made by Production, Model Shop or N/C Shop. Ongoing vendor visits will be required to consult and fabricate test sample parts from vendor temporary tooling. Some in-house finishing of these vendor components will be necessary by the Model Shop or N/C. Personnel required to implement this Phase II are: four Model Makers and two Engineers will be required full time, one N/C Programmer full time.

### - Test Phase II Design Samples

Aug.'90 Dct.

These design sample guns will be tested for function, endurance, strength, blow/up, crud and temperature extreme tests, safety performance, dry firing and field function. Two 30-06 and two 7MM Rem. Mag. guns will be subjected to an intentional abuse test. This may constitute some design changes or modification as deemed necessary from test results. Personnel required are: one Engineer and two testers will be required full time and one Model Maker and N/C Designer part time. 

### NEW BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 5

- Redesign

Sept.'90 - Dec.'90

Redesign begins as soon as problems arise during Phase II Testing and continues throughout testing. The test results will determine redesign effort needed to correct any deficiencies of the design. All styling, Marketing, and Legal concerns will be finalized by this time. If a major redesign or management change in criteria is required a substantial amount of time and effort will be required to complete. Personnel required will be one EDL Engineer, one Research Engineer, one CAD Designer, one CAD Detailer will be required full time.

### - Build Design Acceptance Guns

Nov.'90 - Apr.'91

July'91

May/

The purpose of the design acceptance test is for finalizing design component parts to be fully tested in several guns prior to design transmittal to the plant. A total of 30 guns will be built including all five dalibers for a large enough sample to be statistically sound. The majority of parts will be vendor produced parts on permanent tooling and in-house parts produced as much as possible on production machinery that will be used in the process of full production schedules. Some component parts may need finishing operations by the R & D Model Shop or N/C Shop. Also, N/C will aid FMS Operations for programming and debugging. Other current production parts required as used, or if in need of modifications will be procured from the plant. Personnel required will be: two Engineers, two N/C Programmers and two Model Makers full time. Some plant personnel will be required part time.

#### - Test Design Acceptance Guns

Design acceptance testing of 30 gun samples is the final test performed on the design prior to transmittal. No alterations or modifications are allowed during this testing phase to the test guns. The Test Lab has complete control of the testing and performs all testing it deems necessary to verify design for release to production. Control Gun Testing will be run concurrently with New Design Acceptance Test Guns to compare current design with new offering, also to include competitive products where appropriate. Testing will include endurance, field function, drop, dry fire, strength, intentional abuse temperature extreme, solvent testing and accuracy. When the Test Lab has passed these guns on all tests, a written report certifying the gun is acceptable for transmittal is filed. Personnel required are: one Engineer and four Test Lab personnet full time.

CONFIDENTIAL-SUBJECT TO PROTECTIVE ORDER KINZER V. REMINGTON 1212 - W. 179 - 813 - 1

NEW BOLT ACTION RIFLE (N'BAR) - CONT'D. PAGE 6

Mini Redesign and Drawing Transmittal July'91

By this phase of development, the design is firm and no major setbacks should occur. Only minor changes or updates should take place. Changes will be limited to process updates, improving endurance, cost effectiveness, and improved functionality only on parts found to be problem areas from previous testing. Initial transmittal of Research Model drawings and specifications takes place at this time. Personnel required are: one Engineer and one CAD Draftsman full time.

- Project Approval (Decision Point)

July'91 - Aug.'91

During this period, final management approval of the design is given and money is released to begin production tooling. All pertinent economics and production process estimates will be completed for this project approval report.

- Draft Manuals

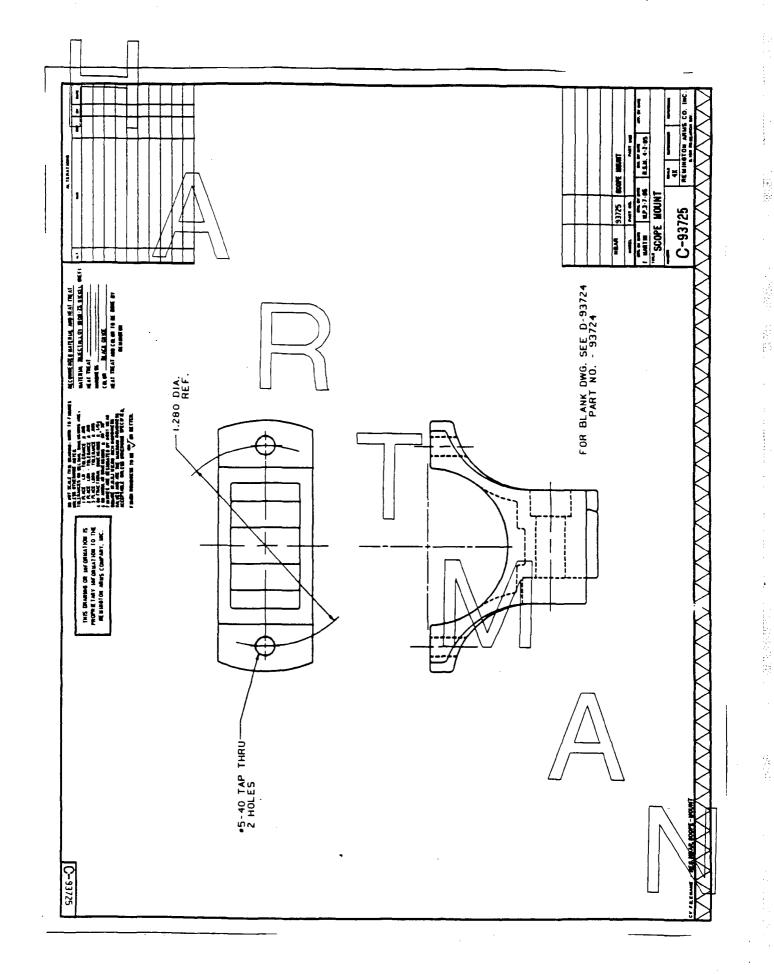

Aug.'91 - Oct.'91

This involves development of text and illustrations for the owners manuals and instruction booklets and field service manuals. This will be prepared in conjunction with a commerical printer. Personnel required are: one Engineer and one Draftsman part time with input required from Legal Department and Customer Service.
