That is correct. For DAT we just started with the current Model 770 fire control parts and swapped out only the parts that were new. The only part that the new trigger block fire control would have in common now with the X-Mark pro (Iliion) would possibly be the safety detent spring.

Vince,  
I was reviewing the parts for the M770 Trigger Block Fire Control and the question that came to mind was:

This Trigger Block Fire Control uses the same sear safety cam as the current fire control? Is this correct?

Gerald
