MODELS 1100 and 670 - SMALL GAUGES - Possible Design Changes

The following items are being investigated for possible design changes to improve endurance of the individual parts. Marked prints of the proposed changes will follow as soon as possible.

Breach Bolt - 410 Gauge

Basically 28 Ga. with the following revisions. The left hand well increased in thickness by changing contour including cone change on the front left section. This latter cut applies to 410 Ga. only.

Barrel Extension - 410 & 28 Gauges

Accommodates breach bolt changes.

Locking Block - 410, 28 & 20 Gauges

The forward slide contact surface lowered .025 and the feet on the locking block lowered .025 also.

Action Bar Slide

Reduces height by removing .025 from top bolt handle section to conform with increased section of locking block.

Action Bar Sleeve

Center section similar to 12 Ga. Magnum for skeet guns only.

28, 410 and 20 Gauges

It is being proposed that we provide two types of guns in all three gauges, one type for skeet and the other for field use. The skeet guns would contain the heavy action bar sleeve, 2 1/2" chamber and a different orifice. Field guns would be as originally proposed with the all purpose 3" chamber.
