Nonthly Report - February

A project has been written requesting an appropriation to cover development of draw rifling for commercial use.

The detail drawings on the M/lx-721 are 85% complete and 50% of the parts are fabricated.

A test was made on 5 M/710's and 2-W/510's to determine if a more economical receiver (open bottom) affected the accuracy in any way. The preliminary test indicated that no significant difference exists between the regular and the experimental type.

A test was made of Pentrated and Parker Lubrized M/610 barrels. The Perker Lubrized bore was very inaccurate. Results with the Pentrated bold and sate of the work would be necessary to evaluate it completely.

Preliminary tests on draw rifled M/37 barrels show promising results.
