MODEL 40X BARREL DIMENSIONS

I seem to have misplaced the copy of recent report memo which you sent up to us by P.H. Burdett regarding results with the two actions fitted with special barrels. Believe may have passed it on to H.J. Hackman together with information which Morse and Walker had discovered in the plant regarding an operation which was found to be causing the damage to the chambers you report.

The minutes of the last Operations Committee Meeting from Burdett indicate that we are to provide some new barrels, but am not sure that we know what to give you. According to the measurements here the diameters of the bore and groove as well as the groove width and groove depth fell within your specified limits. As I recall, you were not able to confirm these without the air gage plugs.

Am not sure that the Plant is making any more 40X barrels at the present time for us to select from, but at any rate suggest that you give us another call or note so that this can be properly buttoned up.
