

REMINGTON ARMS COMPANY, INC.

GENERAL INFORMATION

PROJECT NO.

CLASS NO.

INTRODUCTION

The Models 721-722 Center Fire Rifles were introduced in 1948. These rifles became very popular with the trade, and sales were outstanding for a number of years after introduction for this type of rifle.

The stocks on these rifles have been furnished with an optional specification for either a high comb or low comb depending on whether or not to be used for telescope or open sights. The variations have increased inventories and resulted in some dissatisfaction on the part of the dealers and purchasers of these models, especially with the low comb, which is furnished with a high comb stock unless specified otherwise. This rifle is fitted with standard open sights, resulting in a sight line which is unsuitable for most shooters that do require a telescopic sight.

Another improvement requested by Sales Department is a new Safety. Despite the changes made to the finger piece in 1953, the Safety was still not considered adequate; therefore an entirely new design has been made for the safety lever together with a linkage which permits use of the existing fire control.

After careful consideration and investigation into the sight lines of the Center Fire Rifles, the Sales Department has requested that the new "All Purpose" Stock be designed; one which would be suitable for use with either open or telescopic sights. Sample models have been built for the Models 740-760 and for the long stock Model 725 (except for the Monte Carlo feature) and approved by the Sales Department.

INTRODUCTION

A project has been prepared for the Models 740-760 in order to accomplish a longer sight line that is approximately the same height as that for the more popular telescopic and mount open sights.

The Models 721-722 Center Fire Rifle modification program will include a new sight along with new sights, etc.

Based on forecast sales, the proposed selling prices and estimated operative earnings for the Models 721-722 as compared with the Models 721-722 Modified are as follows:

	Models 721-722	Models 721-722 Modified

% of Net Selling Price		

DESCRIPTION OF PROPOSED WORK

It is proposed to complete the development, engineering and procurement of selling and equipment to place these Models 721-722 Center Fire Rifles in production, with the new sight line and safety.

PATENT SITUATIONREMARKS

Upon completion of the project RI _____ and this project, The Models 740-760-721-722 Center Fire Rifles will provide open sights which can be used with or without telescopic sights.

The estimated increase in net earnings _____
