

Design and OperationBrowning BBRBarrel/Receiver

The receiver and barrel assembly of this rifle is similar to the Remington M/742. The assembly consists of a separate barrel extension containing multiple row locking lugs and a separate recoil lug which is part of a ring sub-assembly. This ring sub-assembly slides over the hub on the threaded section of the barrel. Assembly is completed by screwing the barrel into the receiver.

The barrel and receiver is drilled and tapped for sights and scope mounts respectively.
