

RugerBarrel/Receiver

This is a simple two piece design in which the barrel is screwed into the receiver. The barrel is not drilled and tapped for sights but the receiver does have integral scope mounts. There is no provision for use of any other sight system.

The recoil lug is an integral part of the receiver and is located just under and to the rear of the receiver barrel interface. (Photo #1) The right front part of the receiver also contains one gas vent hole. This gas vent can be seen in Photo #11.
