

Components Manufacturing Process - Metal

The table on the following page specifies the major manufacturing processes used by each manufacturer to produce all components listed. The manufacturing processes were arrived at by closely examining each part for characteristics that are common to that particular process. Examples of these characteristics would be an untouched cast surface or a parting line on the part. The processes listed do not represent the sole process used to produce that part. Additional manufacturing methods are used to arrive at the finished product. An example of this would be to further machine a forged receiver as compared to machining that same receiver from bar - stock.
