BOLT ACTION CARBINE STOCK

A meeting with Jim Rodersheimer from EDL and Art Belair from Computervision was held in Wilmington on October 16, 1981. The purpose of this meeting was to review the database for the Bolt Action Stock with the additional pistol grip sections included and to discuss the development of the master stock database.

The database with the additional sections is now acceptable. The detail through the pistol grip is adequate and there doesn't appear to be any gouging of the surface by the cutting tool. However, while discussing the master stock database development, it was discovered that the cross-sections at both ends of the stock had been omitted from the stock model. The data points for the fore-arm end section were in the computer and will be added. There was insufficient time to determine if the data points for the missing section at the butt end were also in the computer. This data is available and ready to send, if necessary.

At present, a master stock blank (wood) will be ready for machining by October 30, 1981. The N/C tape for machining the master stock should be complete and the wood master machined by November 6, 1981. Machining the aluminum master and the wood copy lathe former will follow. Estimated completion dates for these items are not known at this time.
