PAGANINI SpA

Moreover, during the last test of Remington rifles, the Proof-House of Gardone rejected and kept there:

1 rifle mod. Titanium cal. .30.06	serial number TT000620
4 rifles BDL cal. .300 Win. Mag.	serial number E6741321 - E6743723 - E6743578 - E6743707
3 rifles ADL cal. .270 Win.	serial number E6745641 - E6745637 - E6745629

According to the Proof-House, also these rifles have the same problem with the bolt head, as above described for mod. 710.

We asked the Proof-House to give us the technical data referring to the higher pressure generated by the cartridges cal. .30.06. This technical data follow to this fax, the results of the pressure of 10 cartridges used for the forced tests are listed in the P1 box. As a result, the average pressure is 5347,6 bar. → 77540 Psi

- They used - as you can see in this form - original Remington cases.
- The primers are CCI 250 Large Rifle Mag.
- The powder is PRB gr. 3.30
- Northwest bullet 187 grain.

Moreover we are faxing you a copy of the three letters which the Proof-House gave us; in these letters the reason of the rejection is explained in Italian (we have translated it in English).

Obviously, according to the Italian law and to the CIP normative law, we have to return these faulty rifles to Remington as soon as the Proof-House give us the arms sealed, so that we can take them from Gardone Val Trompia directly to Turin Caselle Airport.

I am sorry for what happened, but I hope that with the information I am sending you, Remington technicians can solve these problems in order to give the opportunity to the hunters to buy this rifle with the certainty of a good functioning, as it suit to Remington's image and fame.

Waiting to receive your reply.

Best regards,

Lello Ambrosio
