Thanks again for calling today about the problems that you've been experiencing while welding the NBAR magazine boxes. I am enclosing two copies of the mag. box print (D-EXP1758 A) which has some changes from the previous drawing:

- * tabs at the front are extended to protrude .140-.160 into the box
- * undercuts either side of the two front tabs were added to reflect what you had done on first rough prototypes
- * flap widths and heights and weldments added.

I have highlighted those dimensions on the drawing which we currently believe to be the most important (although we can change the width at the front of the lips from .385 to .395 if that will help). If you have any questions or troubles with a specific dimension, give me a call and maybe we can make some further changes.

Yours truly,
