Dear Dave,

DO NOT adjust the trigger screws on your firearm. This can put the firearm in an unsafe condition. If you have a heavy trigger pull 5 1/2-6 lbs or more, we recommend sending the firearm to our factory for adjustment.

I would like to know which adjustment screw I need to use to adjust the creep of the trigger. I want to avoid having a slam fire. There are three adjustment screws on the trigger assembly. Two in the front (top and bottom), and one behind the trigger. Thanks for your help. Dave
