

**PROTECT YOUR VALUABLE FIREARMS FROM MOISTURE WITH REMINGTON'S
NEW MODEL 365 MINI-DEHUMIDIFIER AND REMDRI™ 35 DESICCANT**

Madison, NC – For 2005, Remington is offering two new technologically-advanced products that provide moisture protection for your firearms and other valuables when stored – the **Model 365 Mini-Dehumidifier** and **RemDri 35 Desiccant**. Both products prohibit the formation of rust, corrosion and mildew by reducing the moisture levels in the sealed compartments of gun safes and storage cabinets.

The Remington **Model 365 Mini Dehumidifier** is a compact, self-contained unit that attracts and traps moisture inside thousands of tiny granular crystals. Unlike some chemical dehumidifying products, there is no water to drain or spill. The Mini Dehumidifier requires no wiring or extension cords and absorbs moisture into the absorbent granular crystals for 30 to 60 days before a color coded indicator window lets you know when its time to recharge. Recharging is accomplished by simply plugging the unit into a standard household outlet for eight to 12 hours in an open room and allowing the water vapor to escape. The Remington Model 365 Mini Dehumidifier is the perfect solution providing ease of use and installation in a small rechargeable unit.

RemDri 35 Desiccant is a non-toxic silica gel and carbon granular mixture packaged in spill proof, 16-ounce tear-resistant Tyvek® bags. The silica gel has thousands of tiny microscopic pores which hold and trap moisture, while the granular carbon helps eliminate odors. There is no water to spill or drain as the moisture is trapped inside the tiny granules. RemDri 35 Desiccant is rechargeable for multi-use and has an easy to read color coded indicator which tells you when to recharge. To recharge, simply place the RemDri package in a standard household oven at 200°F for three to four hours or until the indicator returns to blue. RemDri 35 Desiccant helps keep your gun safe or cabinet free from rust corrosion in a low-cost, reusable package.
