

## Model 750 Woodmaster

The Model 7400 line has been historically plagued with performance issues. Discussions with manufacturing have resulted in a position that the current Model 7400 design is a "design on the edge" where issues relating to hand finishing and gas system design (primarily, orifice optimization and location). While there is a new development project on the R&D schedule for an entirely new auto loading center fire design, the horizon for that project is at least two years out. The Model 750 project is a stop-gap measure implemented by manufacturing to improve the rifles performance over a broader range of ammunition. At the same time, the cosmetics of the rifle have been enhanced and brought up to 21st century standards with an improved fore end design, modern laser checkering and a R3 recoil pad.
