

GOLDEN SABER BONDED

An LE Round That Punches Right Through Standard Barriers and Provides Superior Terminal Performance Beyond.

9mm Luger

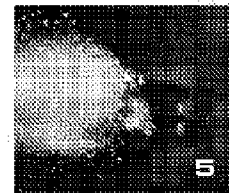

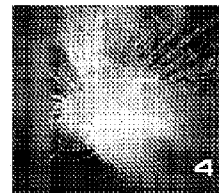

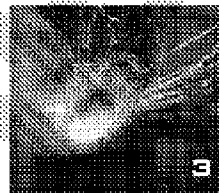

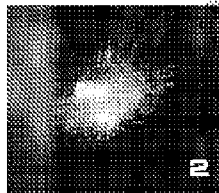

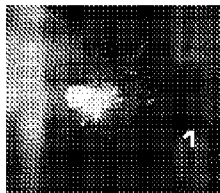

40 S&W

Golden Saber™ Bonded HPJ Provides Unequaled Barrier Performance.

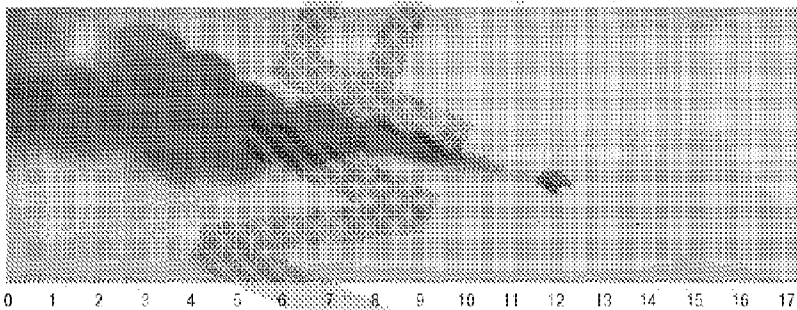

You never know what will be in the way during a critical encounter, but your bullet must slam right through the barrier and provide terminal performance beyond. Our Golden Saber Bonded uses an exclusive Remington **hot-bonded** process to fuse the core and brass jacket, forming a bullet that smashes through standard barriers and provides exceptional expansion, penetration, and impressive weight retention beyond — **up to 97% through auto glass**. In fact, the bonding has increased the bullets' performance through seatboard and plywood, while the jacket and core concentricity and resulting gyroscopic balance maintain match-grade accuracy.

HPJ Bonded
9mm Luger,
147-gr.,
Auto Glass
@ 10' - 1.8x
expansion.

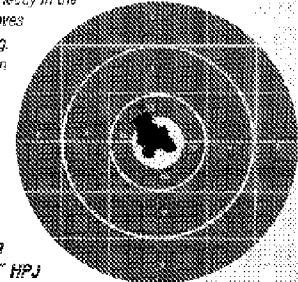

This sequence of high speed photography above shows the superior performance Golden Saber™ HPJ Bonded bullets through automobile glass. In frame 1, the 230-gr., 45 caliber Golden Saber™ Bonded bullet impacts typical automobile windshield glass (the glass is not visible as a sheet because it is lit to be able to see the approaching bullet through it). To represent a shot taken from the left front quarter of a vehicle, the glass is set at an angle of 40° to horizontal and the center line of the gun bore is offset 15° to the side. In frames 2-4 the Golden Saber™ passes through the windshield and, in frame 5, emerges from the glass intact. Jacket and core have held together through the stress of penetrating ASI 1/4 inch laminated safety glass.

This block of gelatin was placed 10" beyond the auto glass setup shown above to catch the bullet after passing through the windshield. It clearly shows that even after smashing through safety glass, the 45 caliber Golden Saber™ Bonded still delivers a large-volume stretch cavity with over 12" of penetration.

Golden Saber™ HPJ Bonded bullets have the same, industry-exclusive **Driving Band™** profile that centers the bullet perfectly in the bore as it moves into the rifling. This results in match-grade accuracy and higher velocity conservation.
