Subject: FW: 710 MAG SAAMI JAR-OFF

Attached is the trigger pull and engagement data on the 6 latest Jar-Off test guns. These should of been setup at about 4.5 lbs. trigger pull and .025" engagement. We obviously still have a large difference in both these measurements between sites. We need closer agreement than this, especially for SAAMI testing where we set these to minimum levels. At this point I'm not sure who is right. I'll ask Phillip to come up with a way to calibrate our Dvorak system and then to check our comparitor. At this point I don't know who's right!!

FYI

Scott
