The Analysis of Variance above indicates that there is not a statistically significant difference between the zero and 20 round and 40 round levels for either the "X" or "Y" values for the differences between the Point of Impact vs. the Point of Aim for the four rifles. The average difference between the "X" values at the zero round level and the 40 round level is approximately 1/3 inch. The average difference for the comparable "Y" values is approximately 1/10 inch.
