Gerald, sorry about the confusion on the receivers. We will do better next time. The receiver was the extruded type. Charge the cost of the barrel, receiver, etc. to project number 241429.

After thinking about the short and long action one piece receiver it seems it would be easiest and cheapest to attach the SPL fire control to the synthetic tang or insert. Could not use the side plate on the insert but could have it modified to accept the SPL. This would save most of the in-house fixtures, etc.

Again, sorry about the receivers, thanks for helping with the prototypes.

Will
