3.1.6 Firearms Measurements

3.1.6.1 TLW0010V - Chamber Cast

Casts of the chamber were made using CerrosafeTM. casts and the 30° optical comparator for measurements.

Five chamber dimensions were surveyed using the

Chamber	Dimensions	(LB-153)
---------	------------	----------

1. Dimensions could not be taken from Breech Face slatam. Do not compare to specification.

Dimensions taken using this method indicated that there were several firearms in the sample that did not meet specifications. After investigation it is probable that the measurements that are indicated as being out of tolerance were due to measurement error due to the lack of a physical reference to the bolt face which could not be located using only the eastings. Longitudinal specifications as listed on the drawing are taken from the bolt face and are used to determine the location for taking the diameters listed above. This issue was discussed with production. Production stated that their review of the tooling indicated that the dimensions for the chamber were correct. This, along with the lack of performance problems during testing with the firearms that could be assigned to the chamber, would suggest that the measurements taken using the cast method are probably in error and that the measurements of the production tooling are a better overall measure of the chamber dimensions. *(See Section TLW0010V; B.2)*
