Dear Mr. Steen,

Thank you for your inquiry. Since 1982, the bolt on all Model 700's have been able to be operated with the firearm either in the "safe" or "fire" position. This was changed for safety reasons so that the firearm could be unloaded in either position. We no longer have the old style bolt lock safety available.

My firearm is a 30-06 model 700 mountain rifle and when the safety is in the "on" position I can still lift the bolt and eject the shell in the chamber. This is different than other guns I own. My question is can that be changed so that the bolt will only lift if the safety has been turned "off" and if so how do I go about doing that?
