Thank you for contacting Remington Country. Rifles produced before 1982 was originally installed with a bolt-lock, which means you have to put the safety switch on fire before you can open the bolt. We are offering a conversion at a special price if you would like your firearm converted, so that you can open the bolt at anytime with the safety on safe. I have an older model 700, do not have the serial number in front of me but I will supply it if necessary. My question is this. I cannot open the action, pull the bolt to the rear, unless the rifle is on fire. I can half open the bolt in safe, but I have to place the safety on fire before I can fully open the bolt. Is this usual or do I have a problem. I notice in the military manual on the M-24 system that the rifle bolt will fully open in the safe position? Any help will be appreciated.
